CS2040S
Data Structures and Algorithms

Welcome!

Plan of the Day

Trees

- Terminology
- Traversals
- Operations

Balanced Trees

- Height-balanced binary search trees
- AVL trees
- Rotations

Announcements

Midterm : Tuesday March 9, 4pm

Location: ~13 different venues (mostly MPSH).

Note: In person, face-to-face

Safe distancing: 48 students / room, spaced

Plan of the Day

Trees

- Terminology
- Traversals
- Operations

Balanced Trees

- Height-balanced binary search trees
- AVL trees
- Rotations

Dictionary Interface

A collection of (key, value) pairs:

interface	**IDictionary**	
void	insert(Key k, Value v)	*insert (k,v) into table*
Value	search(Key k)	*get value paired with k*
Key	successor(Key k)	*find next key > k*
Key	predecessor(Key k)	*find next key < k*
void	delete(Key k)	*remove key k (and value)*
boolean	contains(Key k)	*is there a value for k?*
int	size()	*number of (k,v) pairs*

Dictionary

Implementation

Option 1: Sorted array

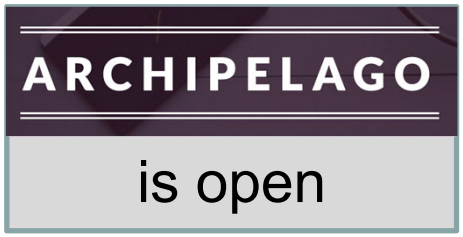
- insert : ? $O(n)$
- search : ? $O(\log n)$

Option 2: Unsorted array

- insert : ? $O(1)$
- search : ? $O(n)$

Option 3: Linked list

- insert : ? $O(1)$
- search : ? $O(n)$



Dictionary

Implementation

Option 1: Sorted array

- insert : add to middle of array ➔ O(n)
- search : binary search ➔ O(log n)

Option 2: Unsorted array

- insert : add to end of array ➔ O(1)
- search : unsorted ➔ O(n)

Option 3: Linked list

- insert : add to head of list ➔ O(1)
- search : list traversal ➔ O(n)

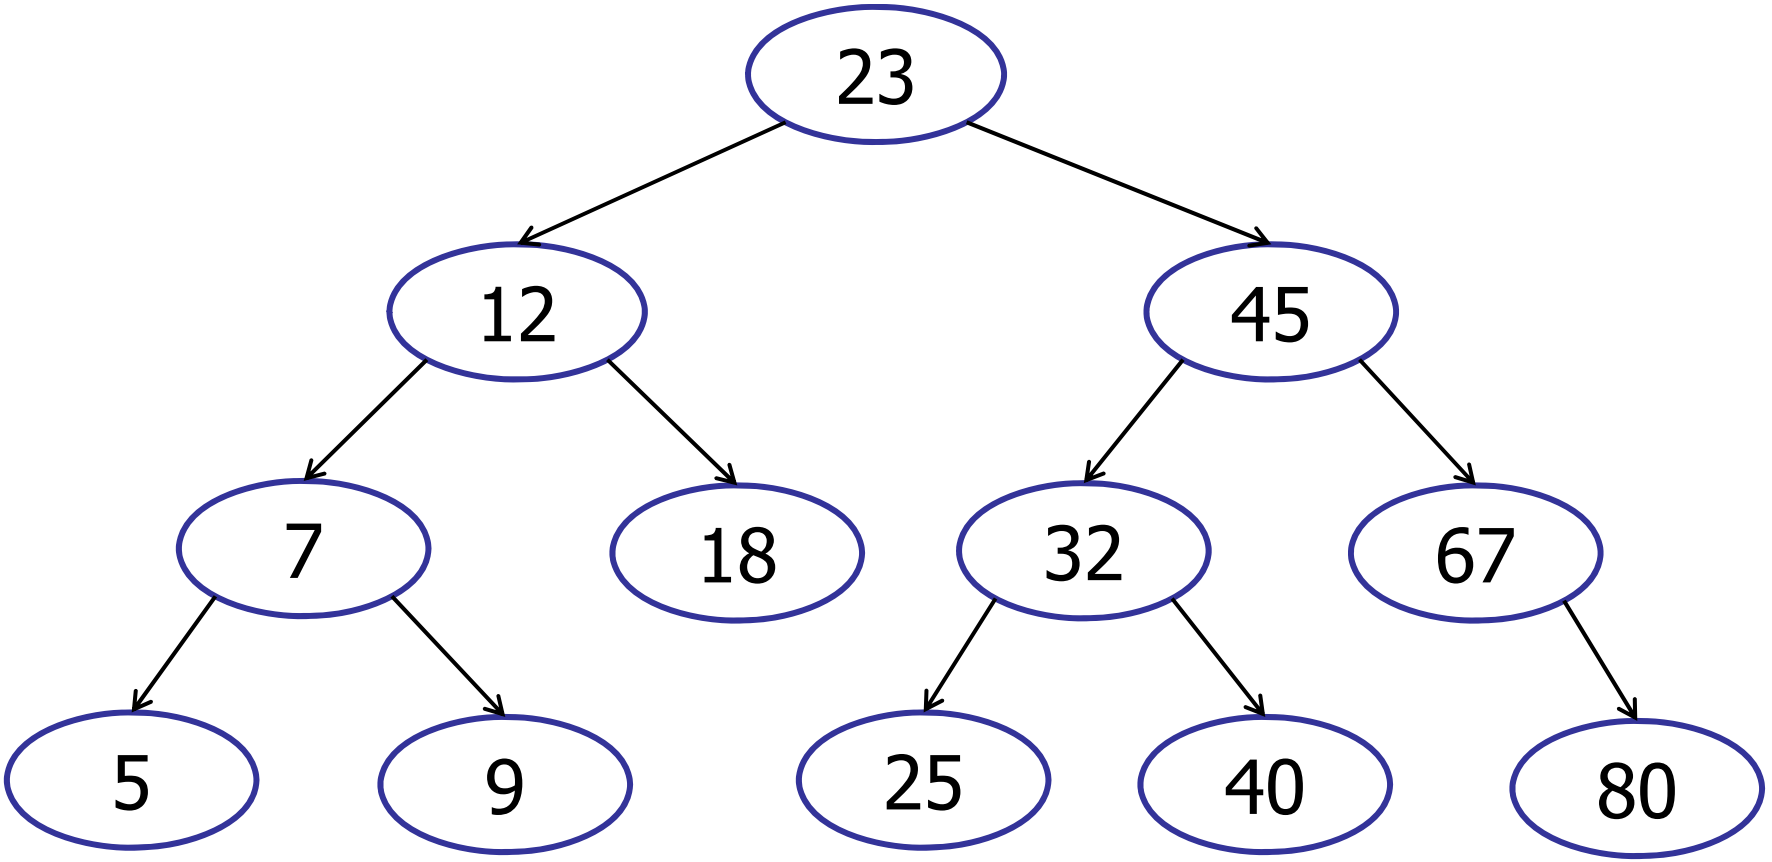
Dictionary Implementation

Possible Choices:

- Implement using an array
- Implement using a Java library (see: java.util.Vector or java.util.ArrayList).
- Implement using a queue.
- Implement using a linked list
- …

Dictionary

Implementation idea: Tree

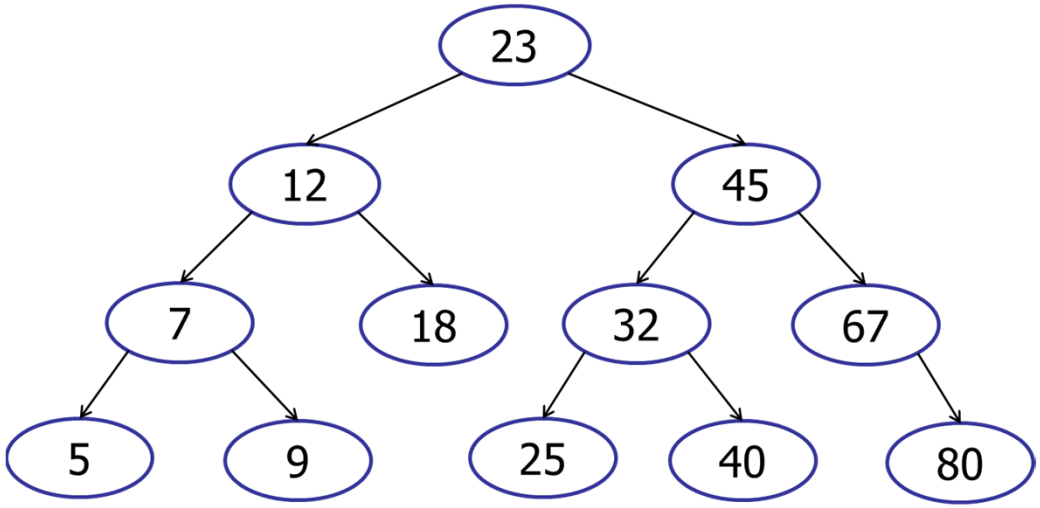


Dictionary

Implementation idea: Tree

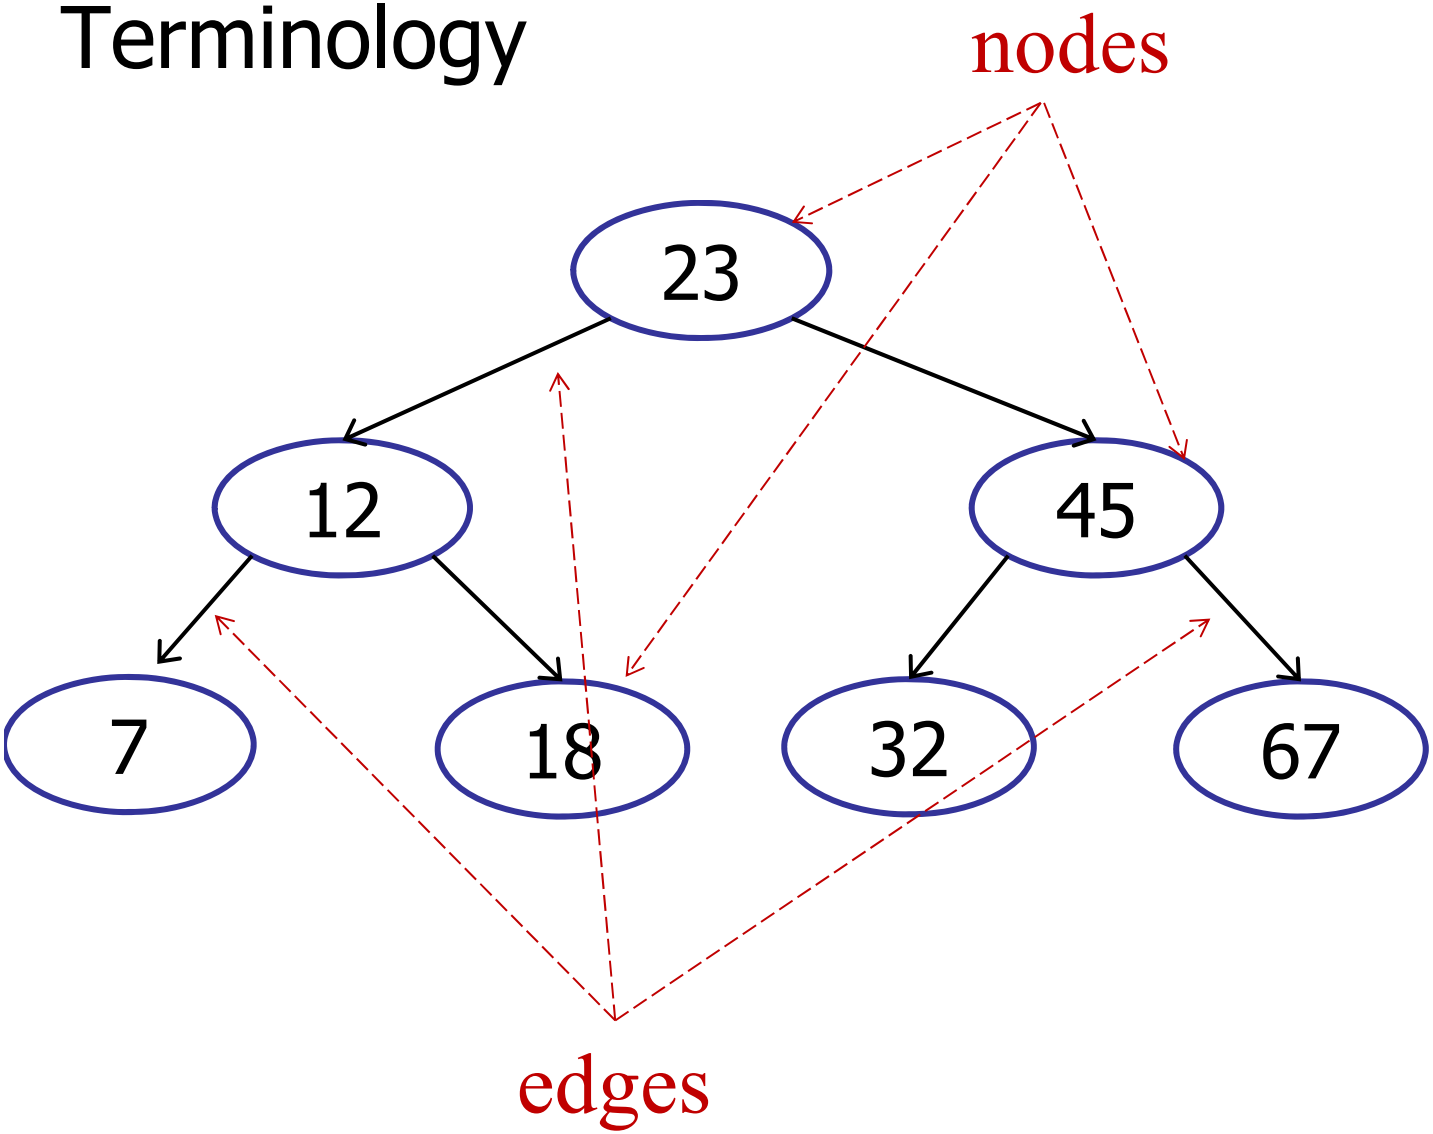
Critical Components:

- Nodes
- Edges directed from one node to another.
- Root (?)
- No cycles



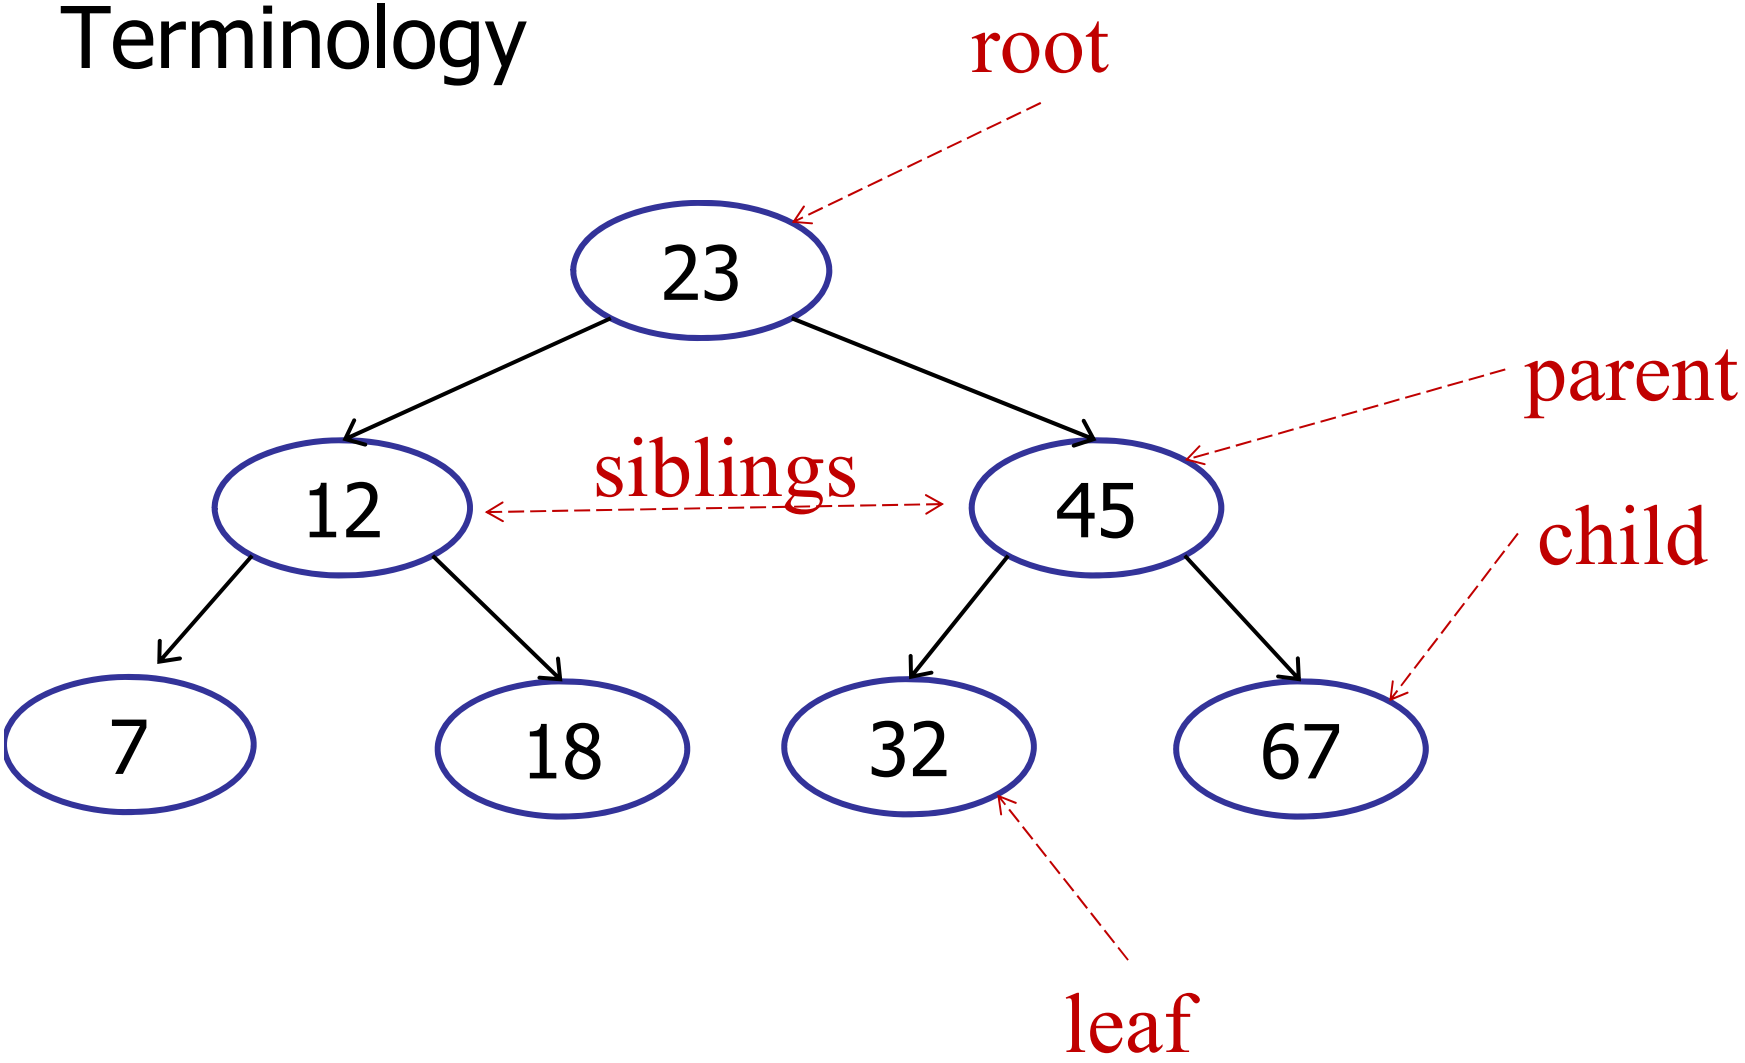
Binary Tree

Terminology



Binary Tree

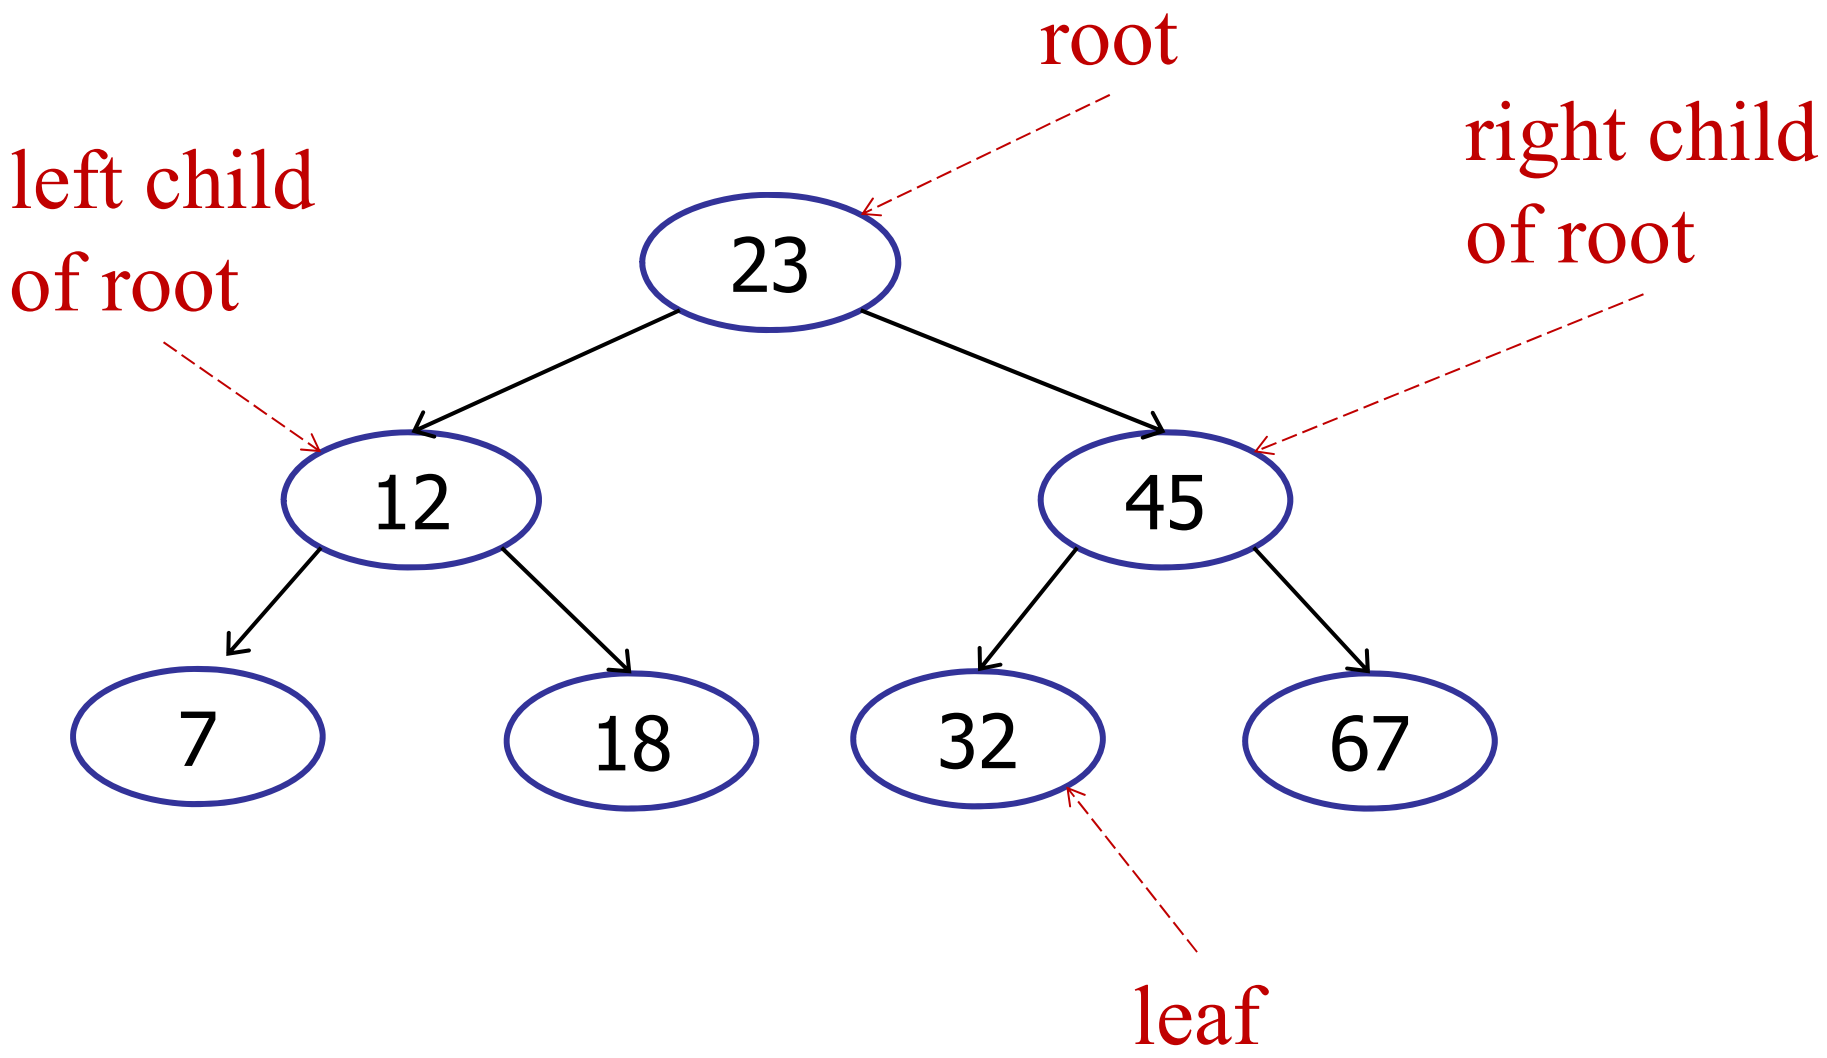
Terminology



Binary Tree

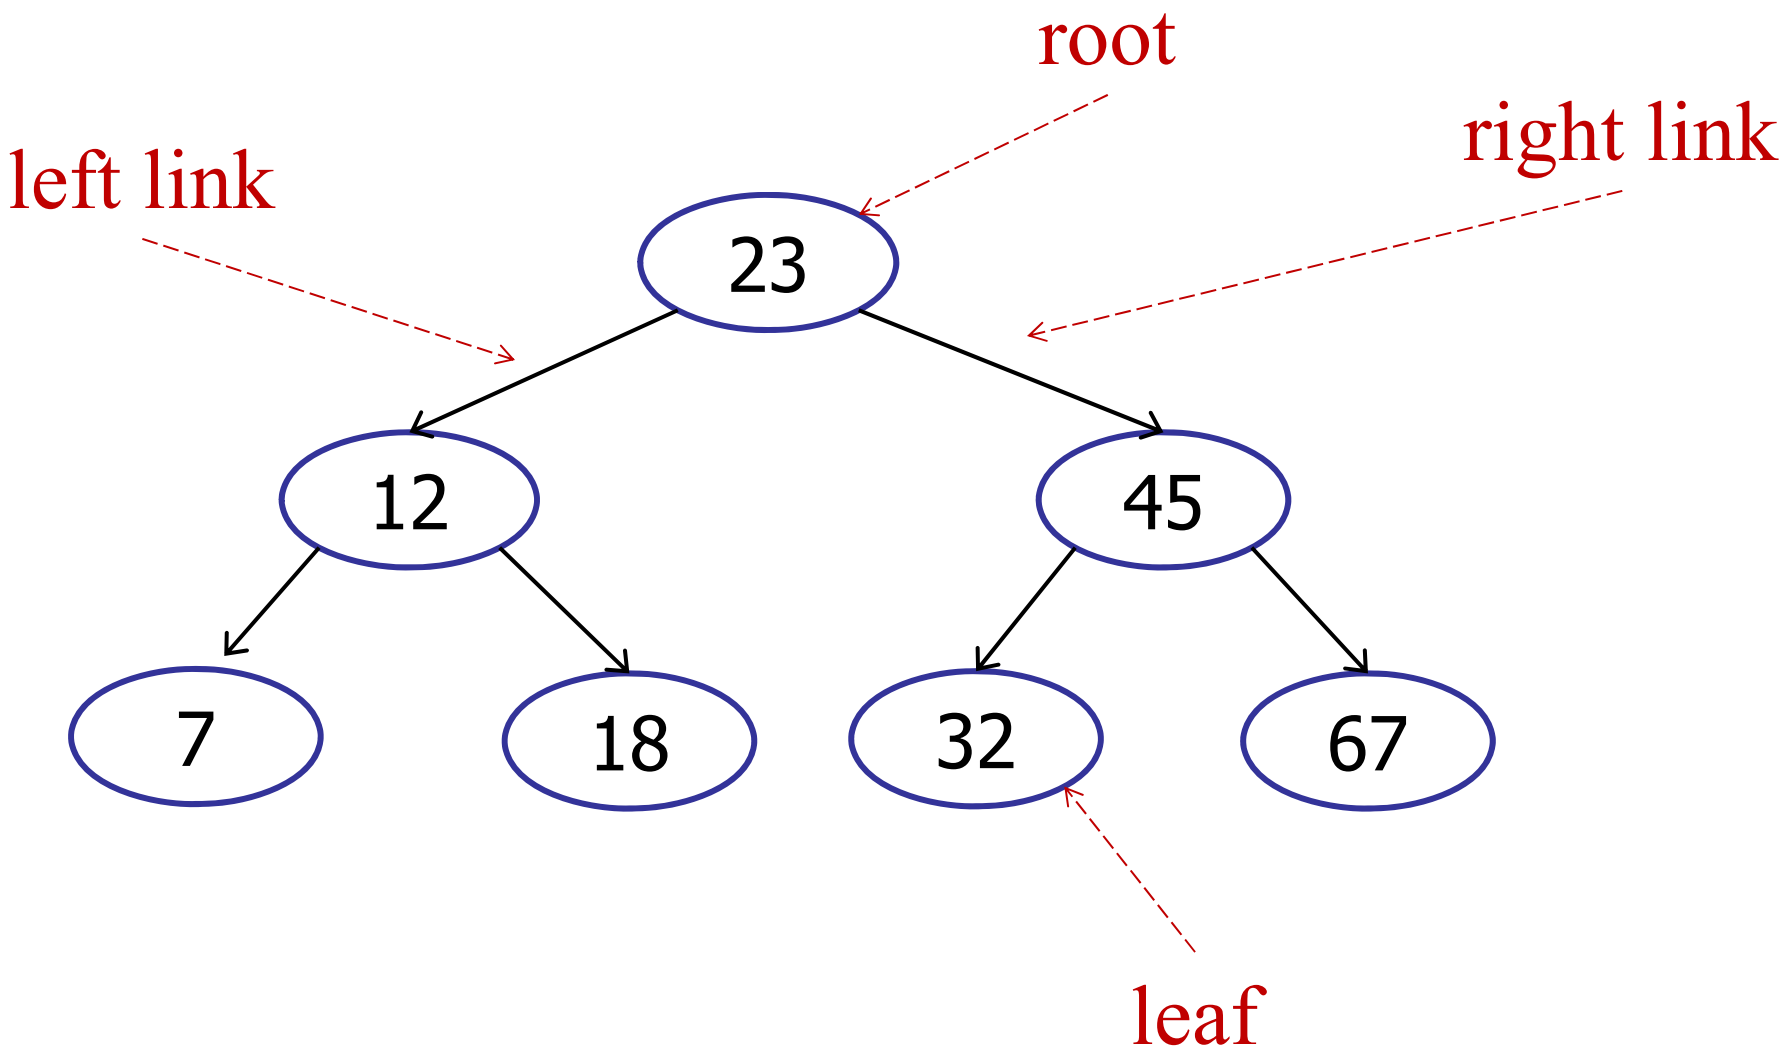
Binary Tree

Terminology



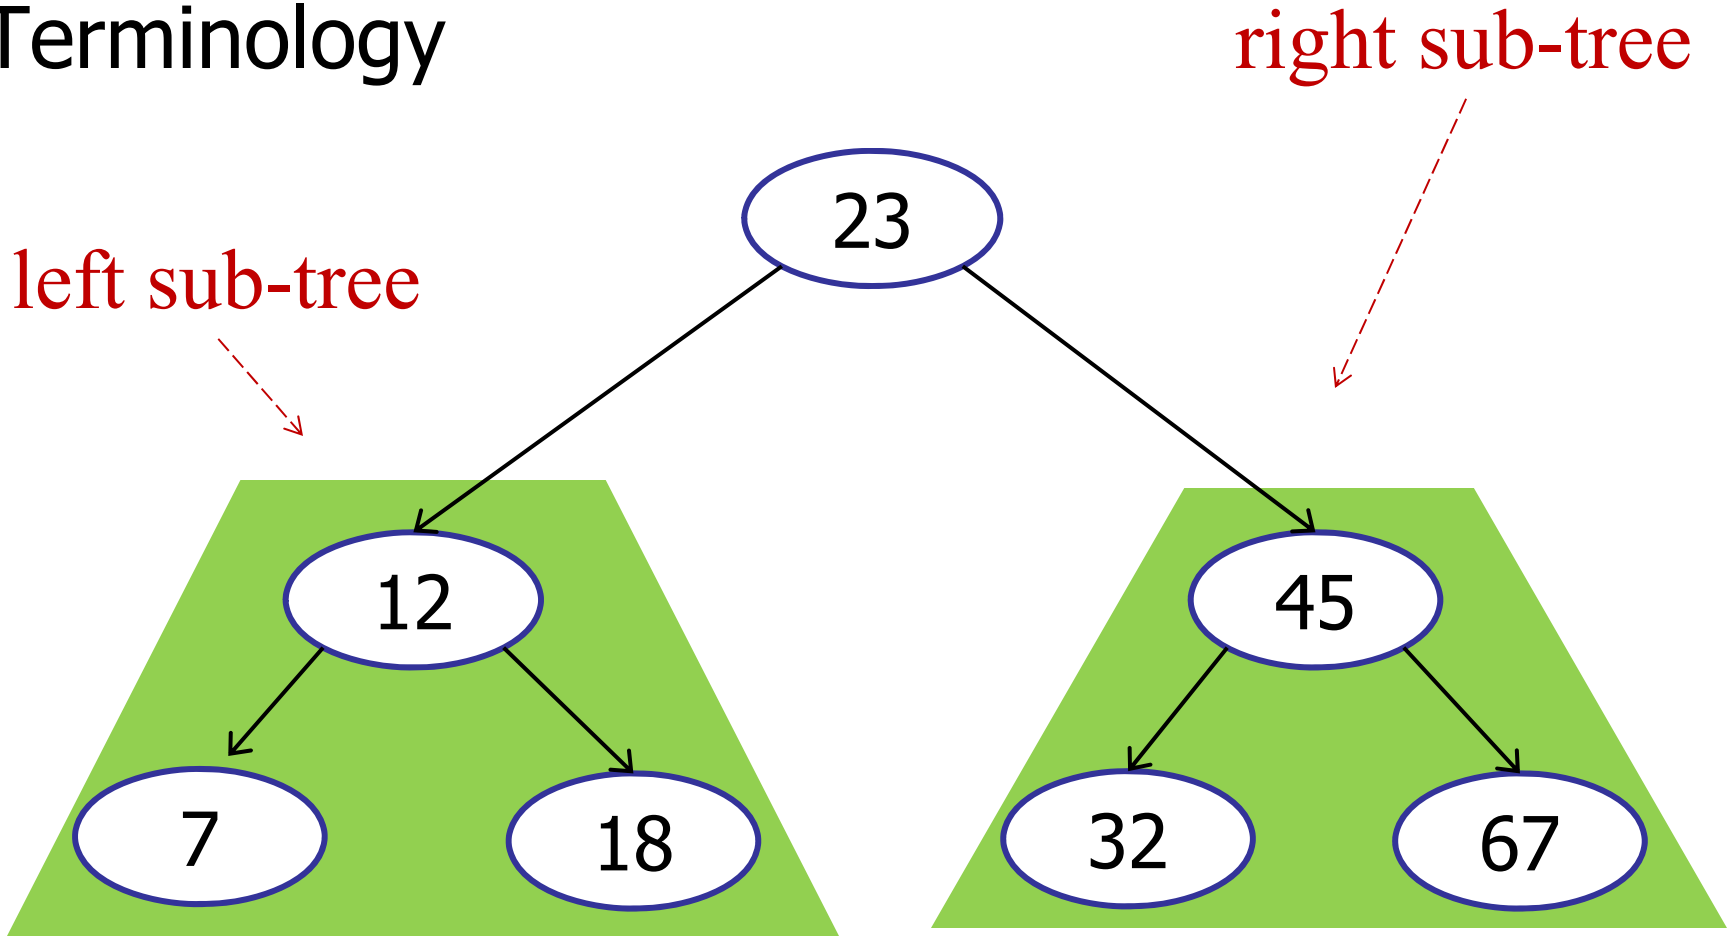
Binary Tree

Terminology



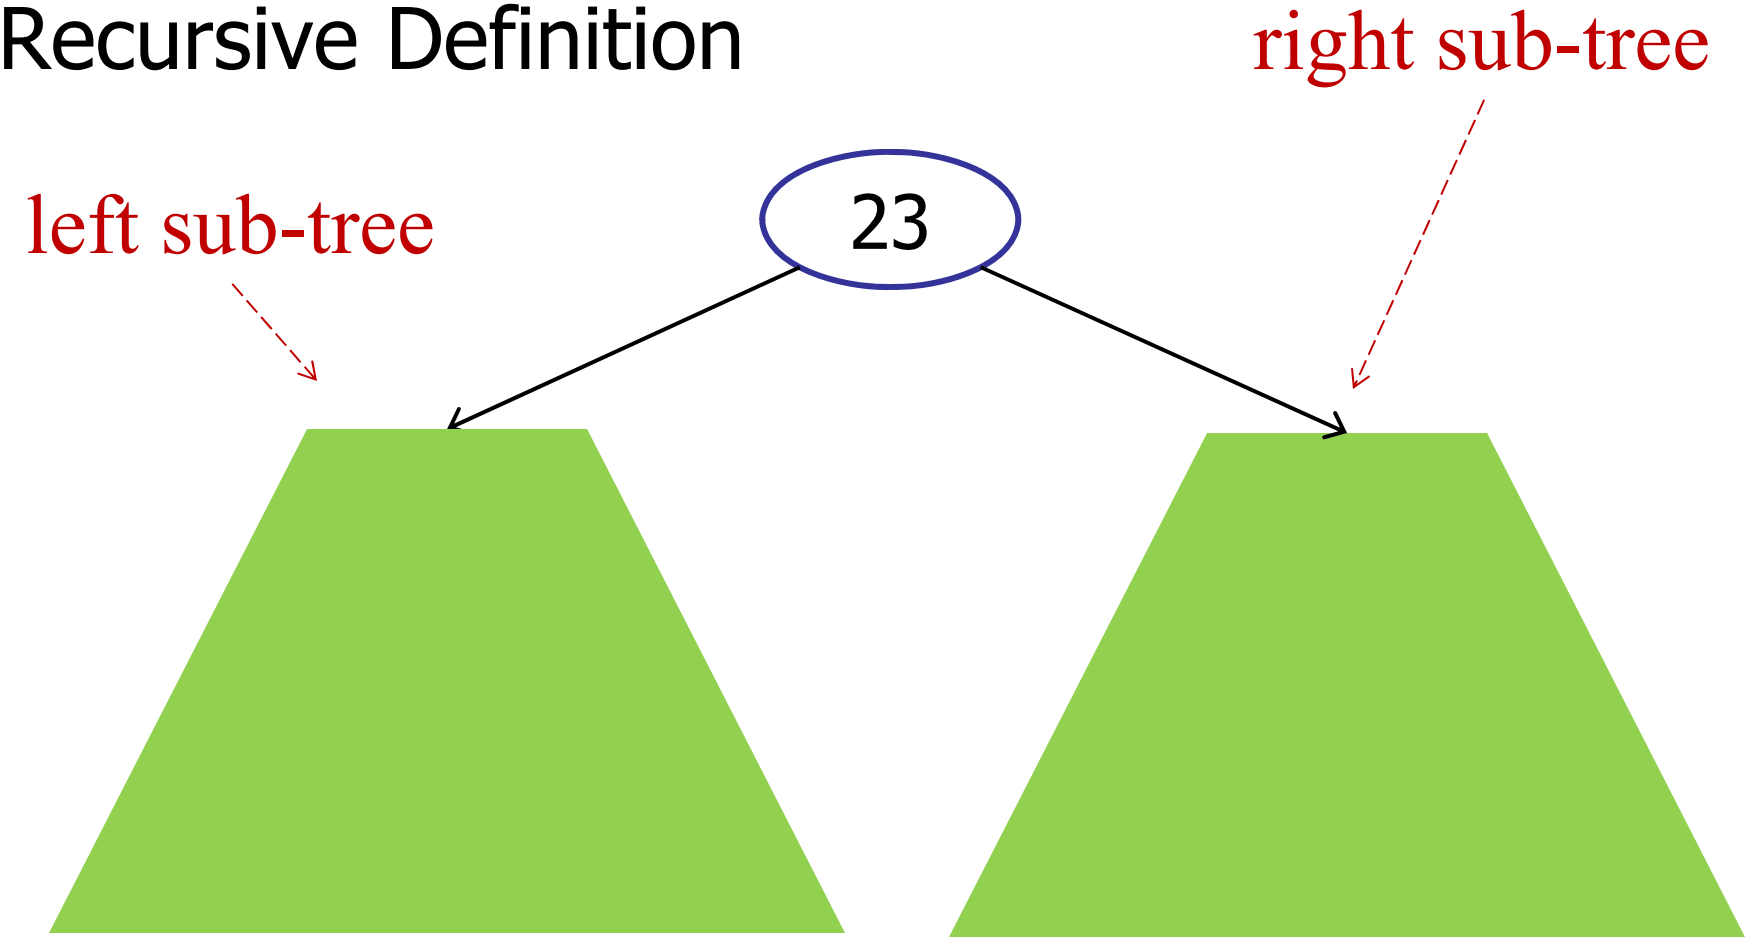
Binary Tree

Terminology



Binary Tree

Recursive Definition



A binary tree is either: **(a) empty**
(b) a node pointing to two binary trees

Binary Tree

Java??

```
public class BinaryTree {

        private BinaryTree leftTree;
        private BinaryTree rightTree;

        private KeyType key;
        private ValueType value;

        // Remainder of binary tree implementation
}
```

Binary Tree

Java??

```
public class TreeNode {

        private TreeNode leftTree;
        private TreeNode rightTree;

        private KeyType key;
        private ValueType value;

        // Remainder of binary tree implementation
}
```

Binary Tree

Java??

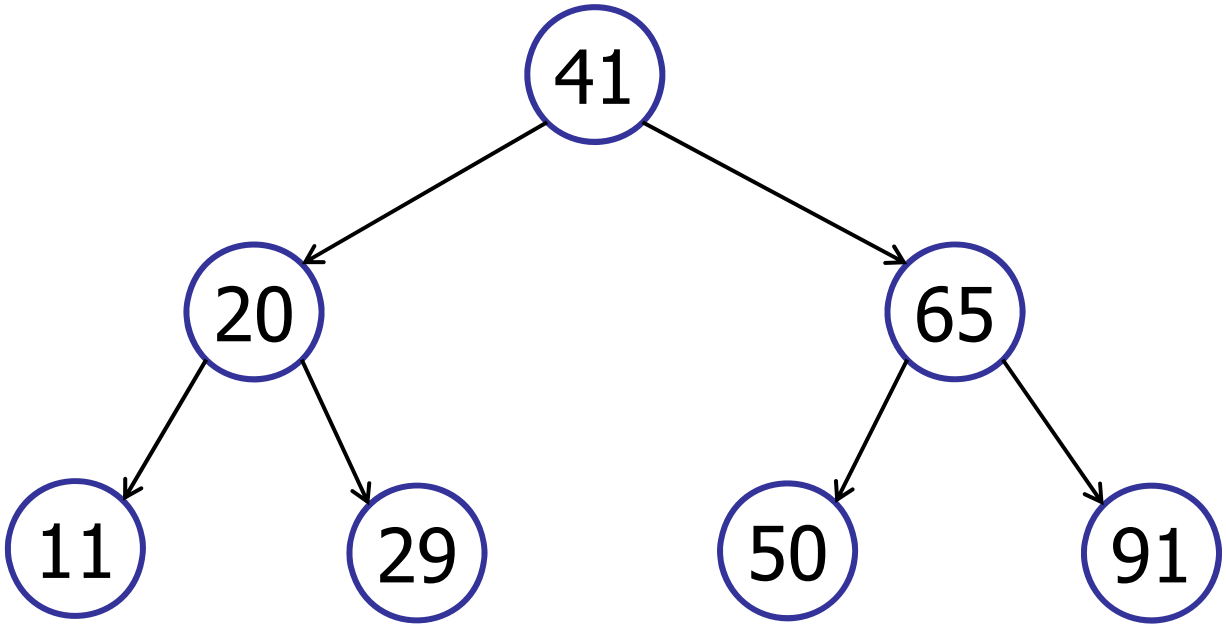
```
public class BinaryTree {

        private TreeNode leftTree;
        private TreeNode rightTree;

        private int key;
        private int value;

        // Remainder of binary tree implementation
}
```

Binary **Search** Trees (BST)

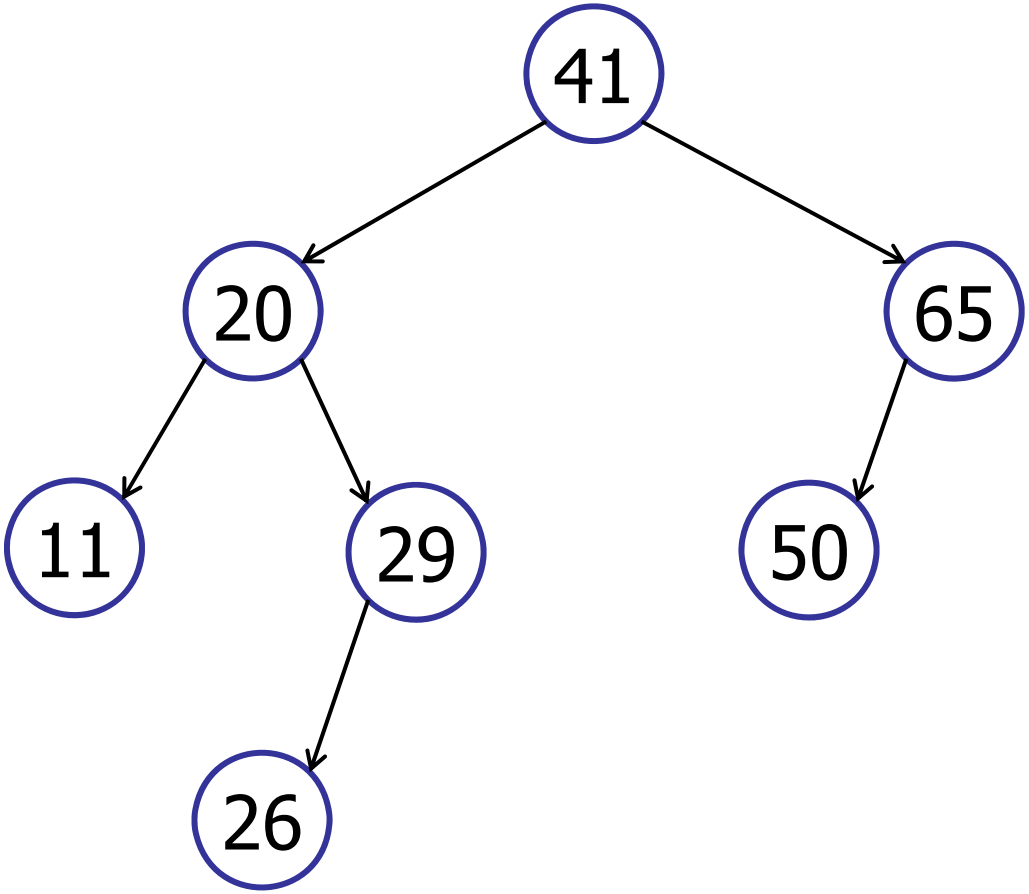


BST Property:

all in left sub-tree < key < all in right sub-right

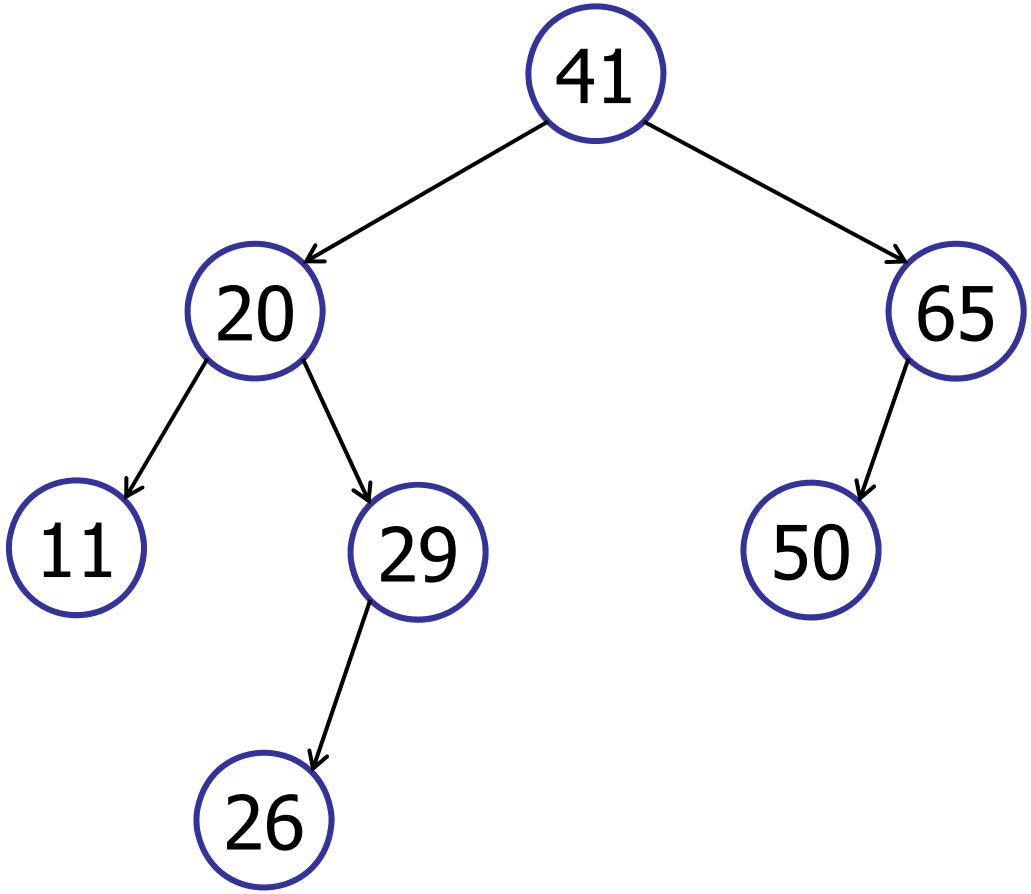
Is this a binary search tree?

1. Yes
2. No
3. I don't know.



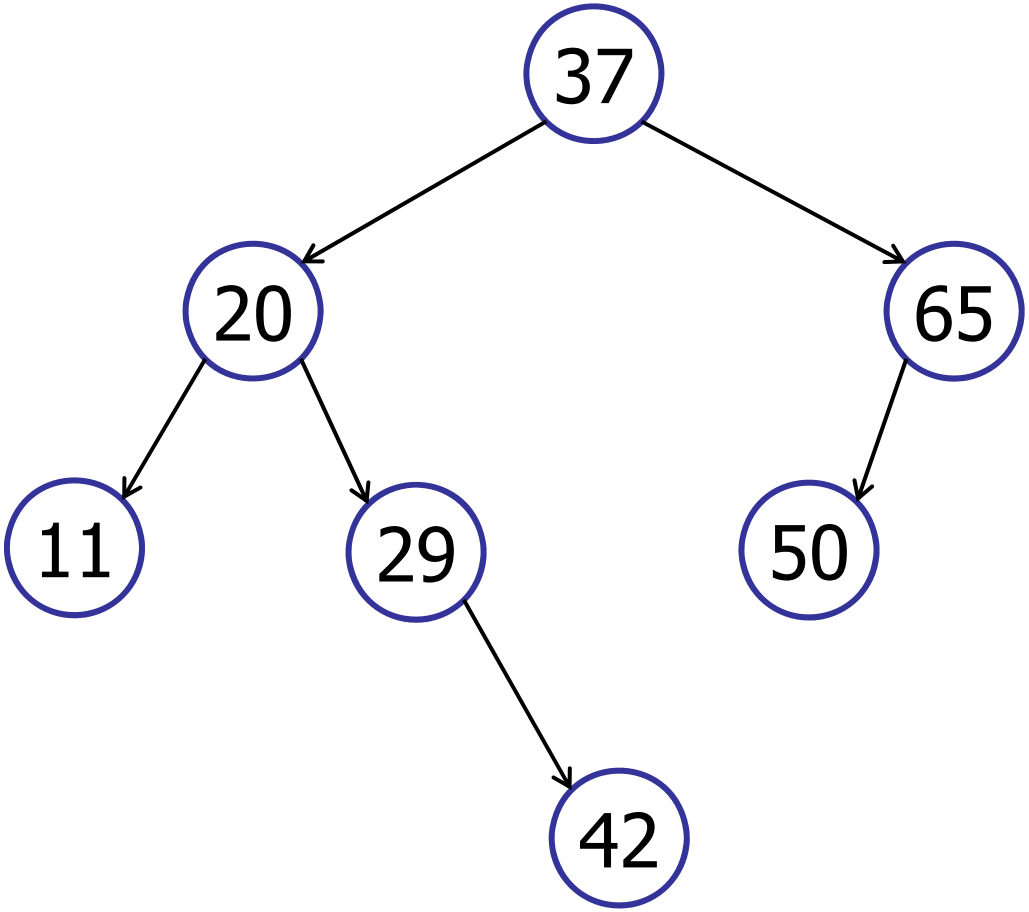
Is this a binary search tree?

✓1. Yes
2. No
3. I don't know.



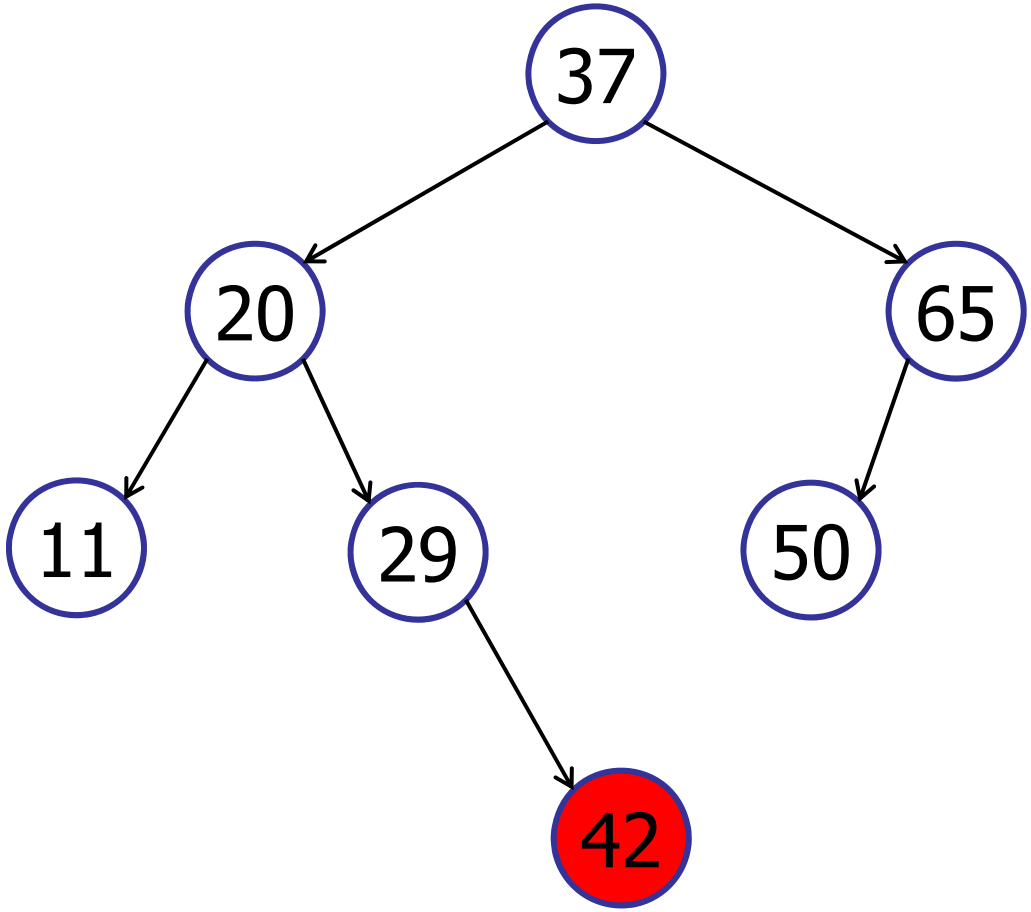
Is this a binary search tree?

1. Yes
2. No
3. I don't know.



Is this a binary search tree?

1. Yes
2. ✓ No
3. I don't know.



Binary Search Trees

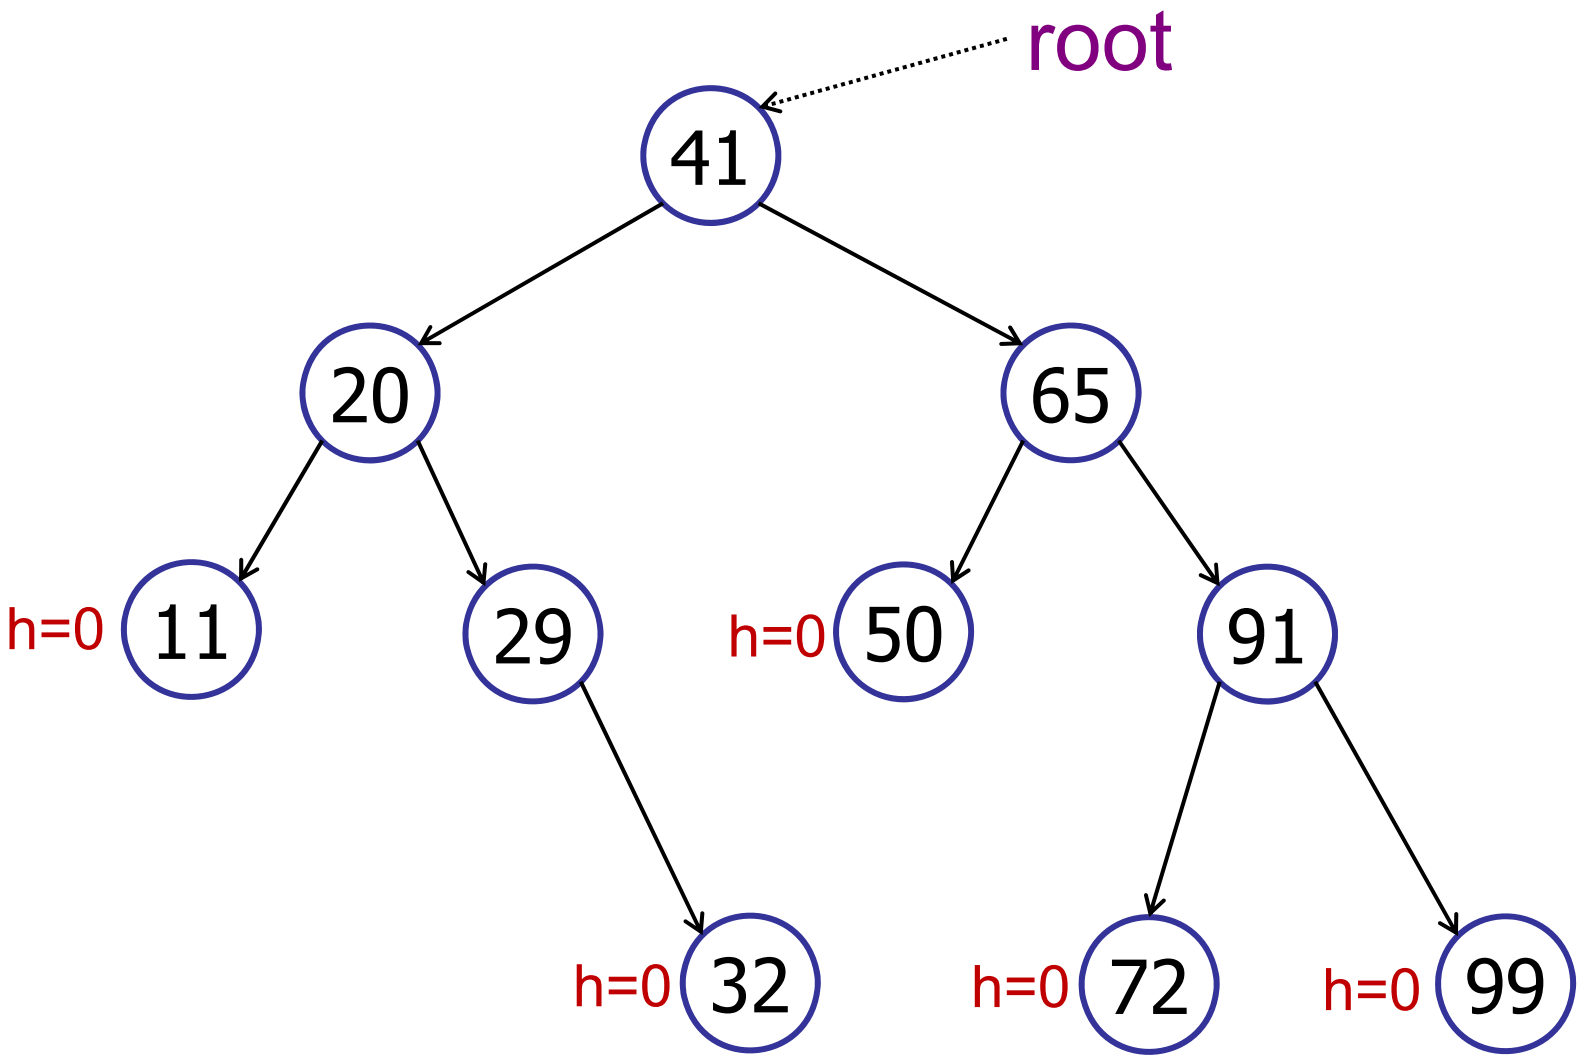
1. Terminology and Definitions

2. Basic operations:
   - height
   - search, insert
   - searchMin, searchMax

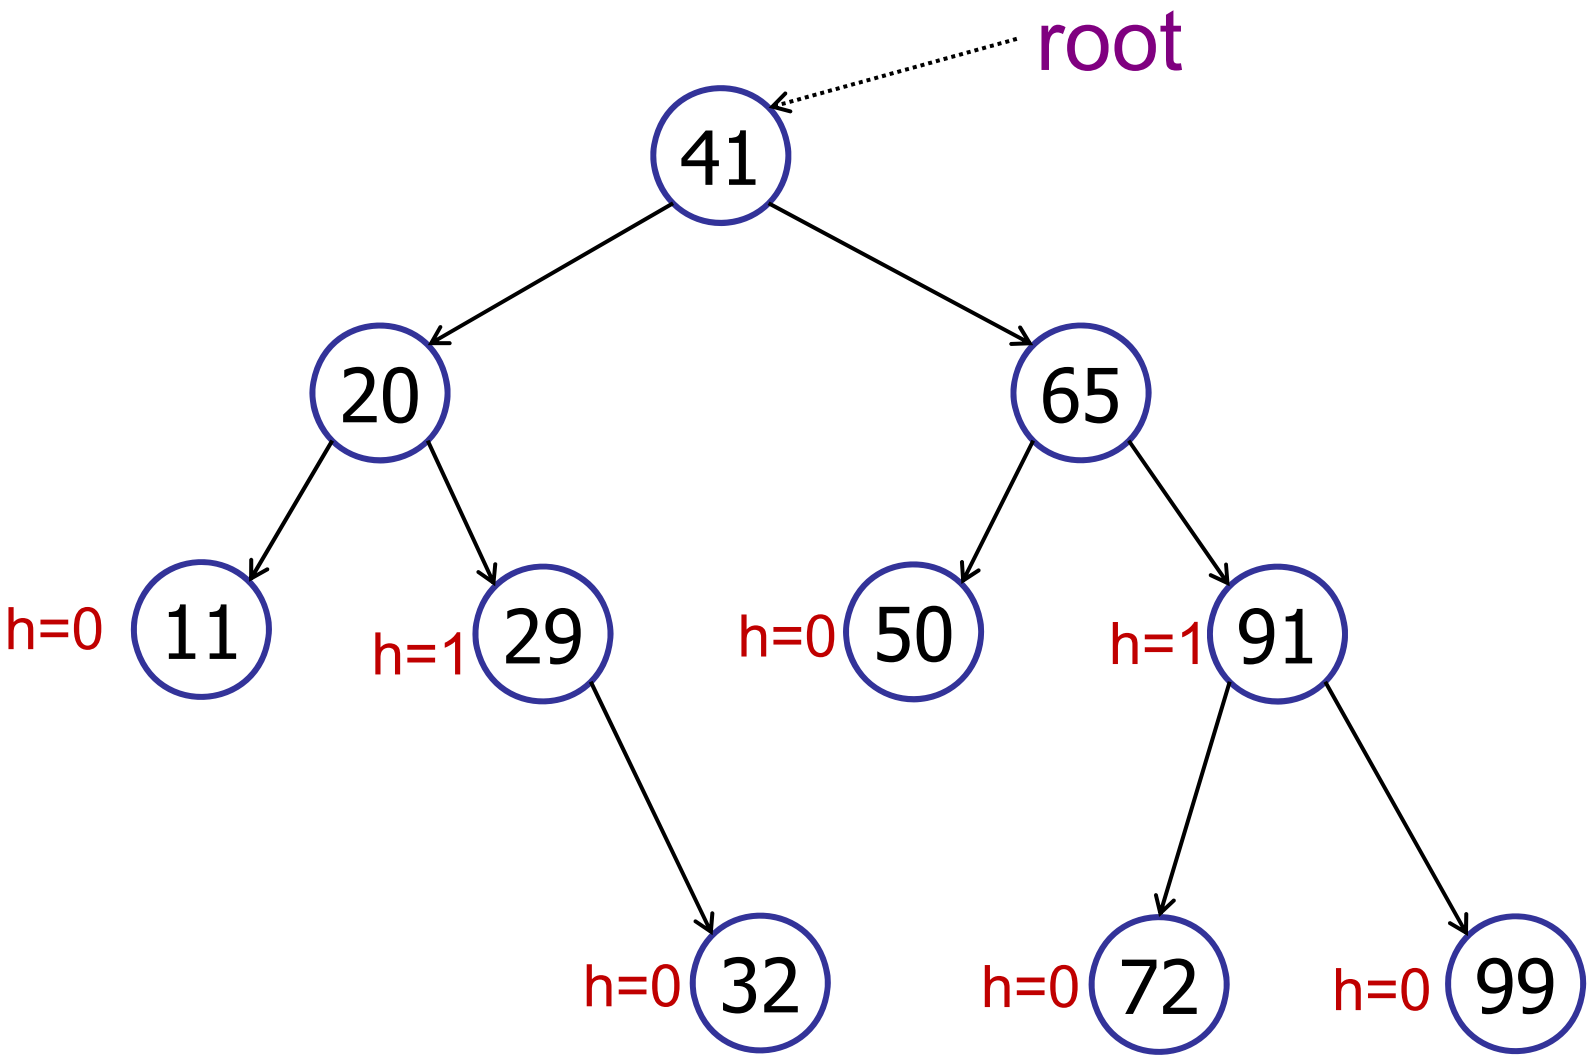
3. Traversals
   - in-order, pre-order, post-order

4. Other operations

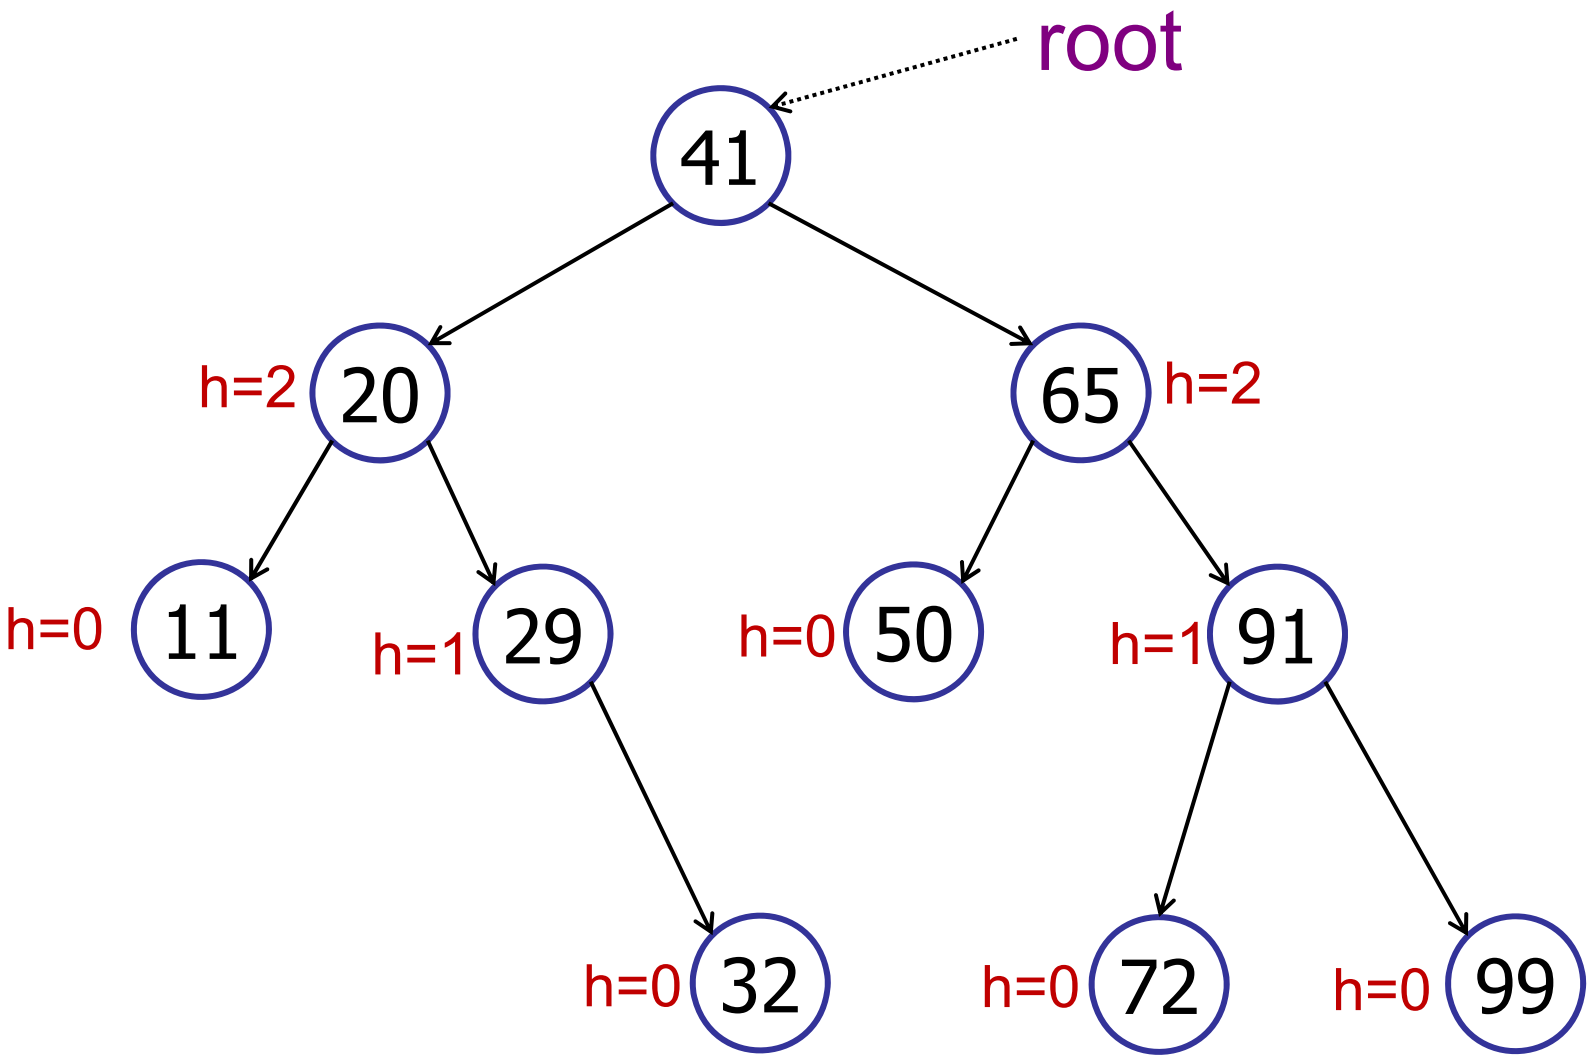
Height of a Binary Tree



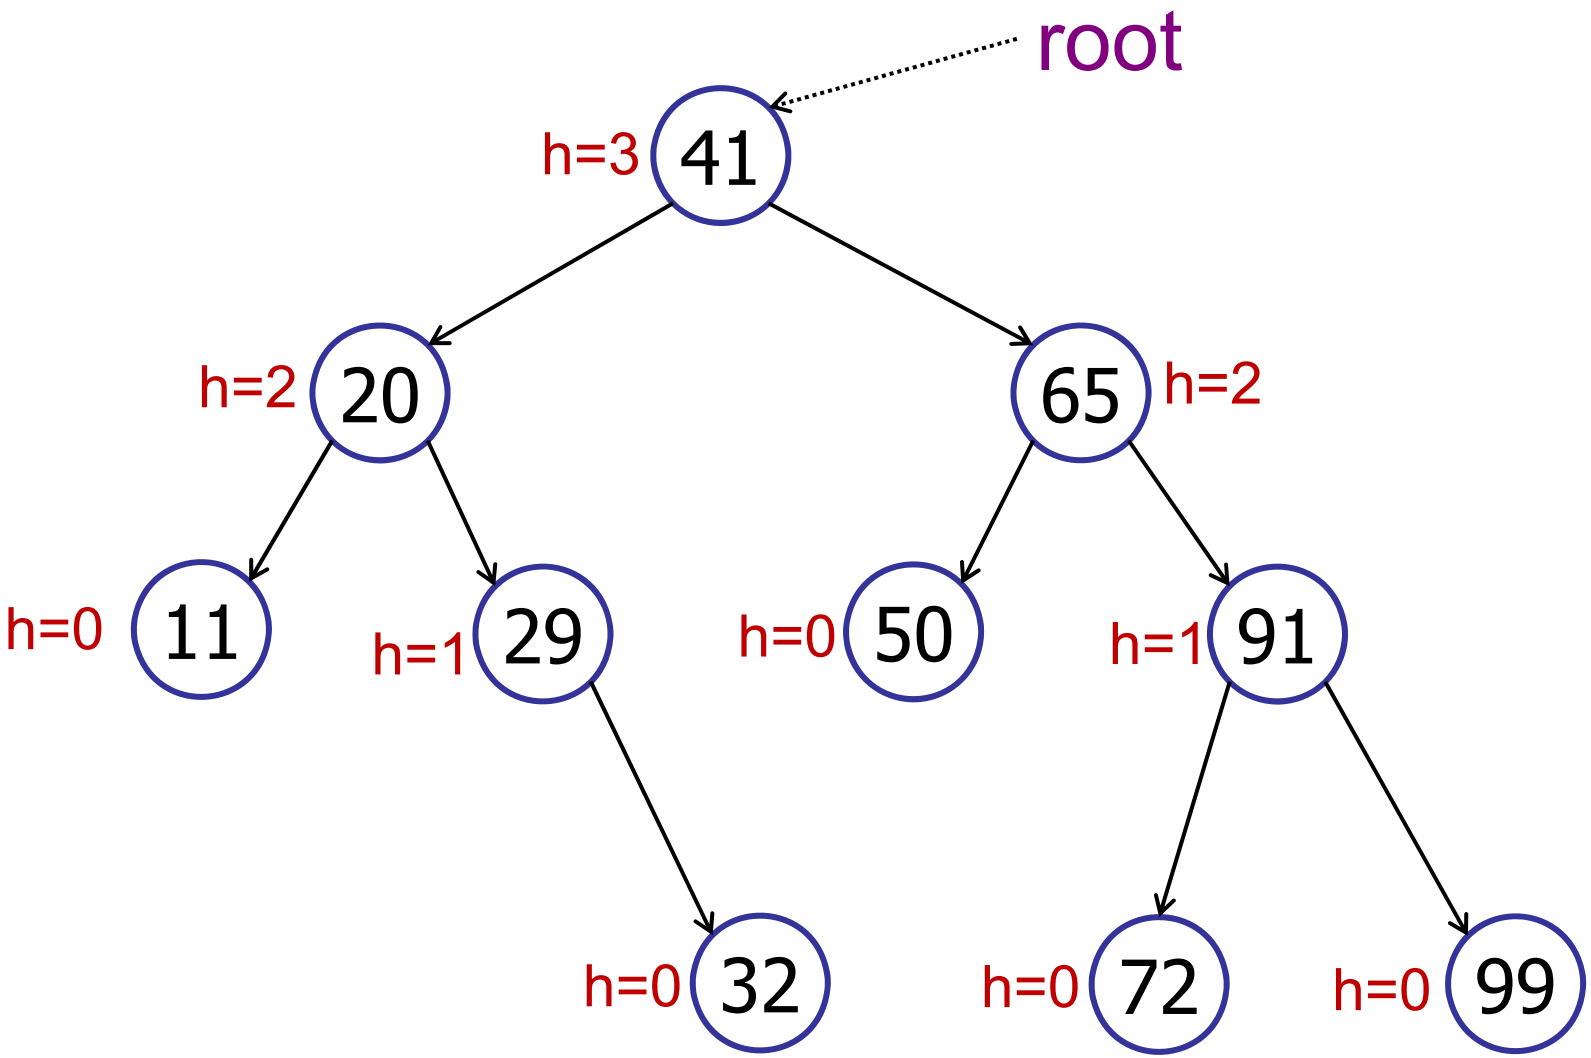
Height of a Binary Tree



Height of a Binary Tree



Height of a Binary Tree



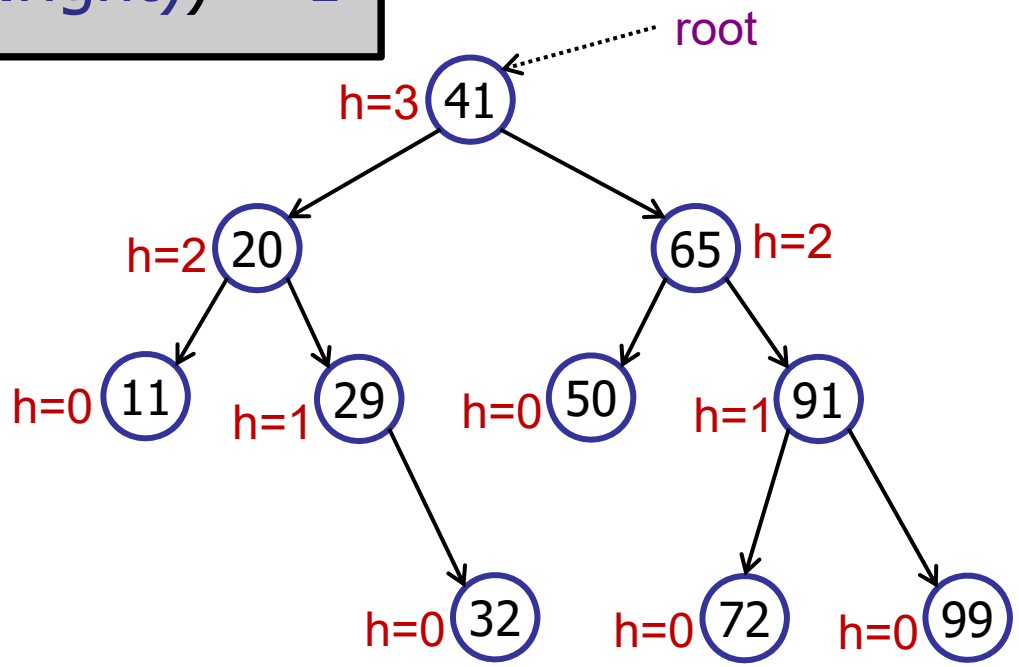
Height of a Binary Tree

Height:

Number of edges on longest path from root to leaf.

h(v) = 0 (if v is a leaf)

h(v) = max(h(v.left), h(v.right)) + 1



(For simplicity: h(null) = -1)

Binary Tree

Calculating the heights

check for null

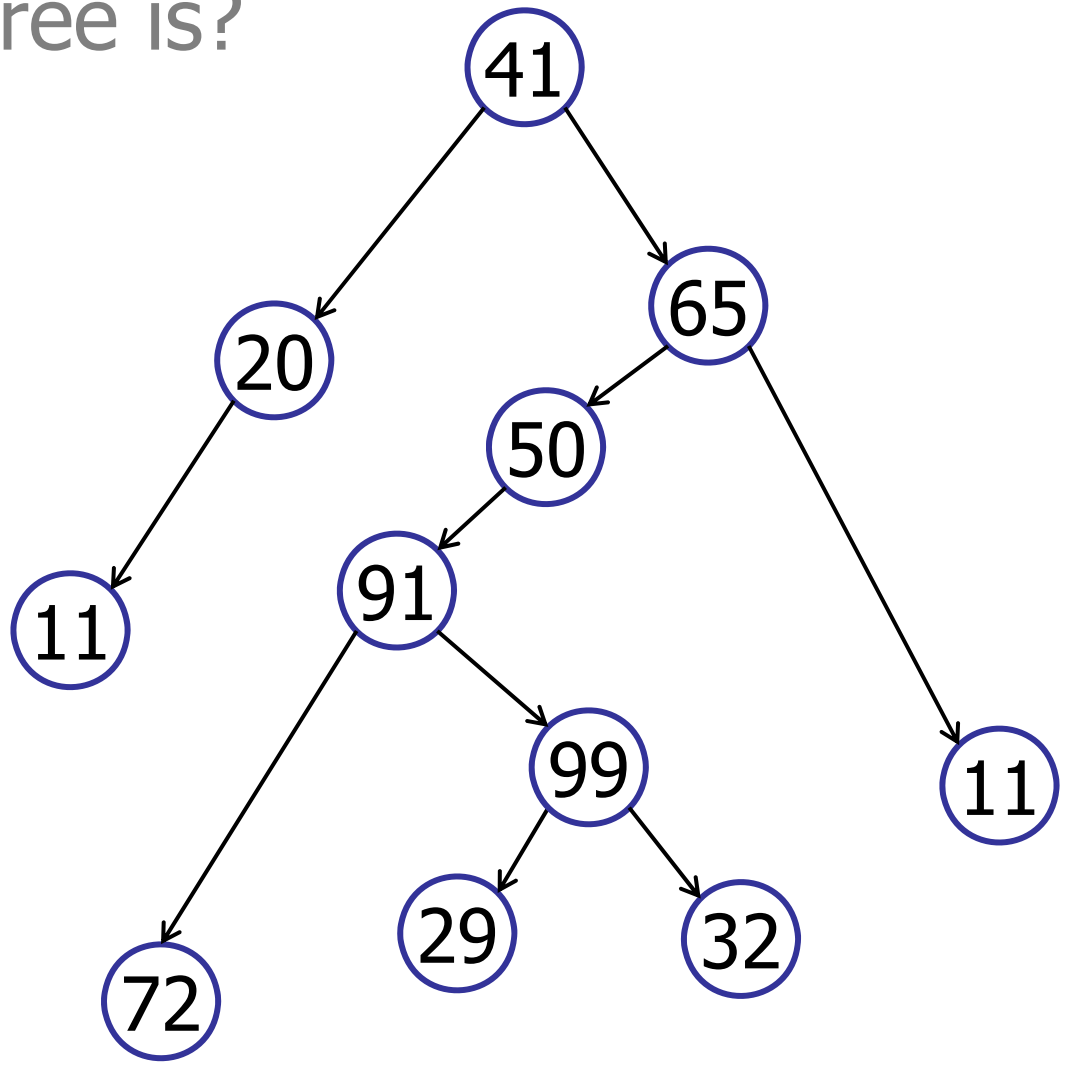
```
public int height(){
        int leftHeight = -1;
        int rightHeight = -1;
        if (leftTree != null)
                leftHeight = leftTree.height();
        if (rightTree != null)
                rightHeight = rightTree.height();
        return max(leftHeight, rightHeight) +  1;
}
```

max of subtrees

add 1

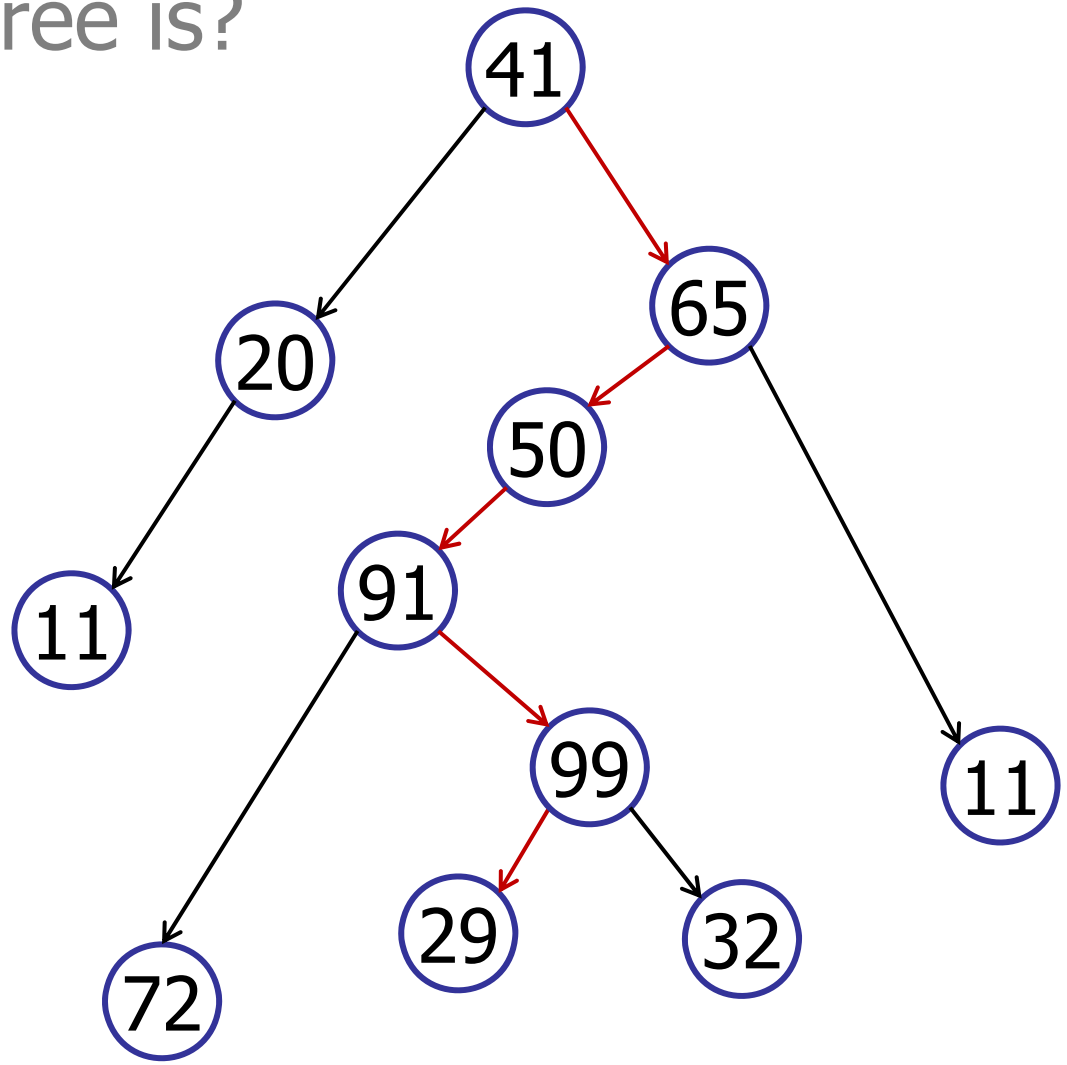
The height of this tree is?

1. 2
2. 4
3. 5
4. 6
5. 7
6. 42



The height of this tree is?

1. 2
2. 4
3. ✓ 5
4. 6
5. 7
6. 42



Binary Search Trees

Binary Search Trees

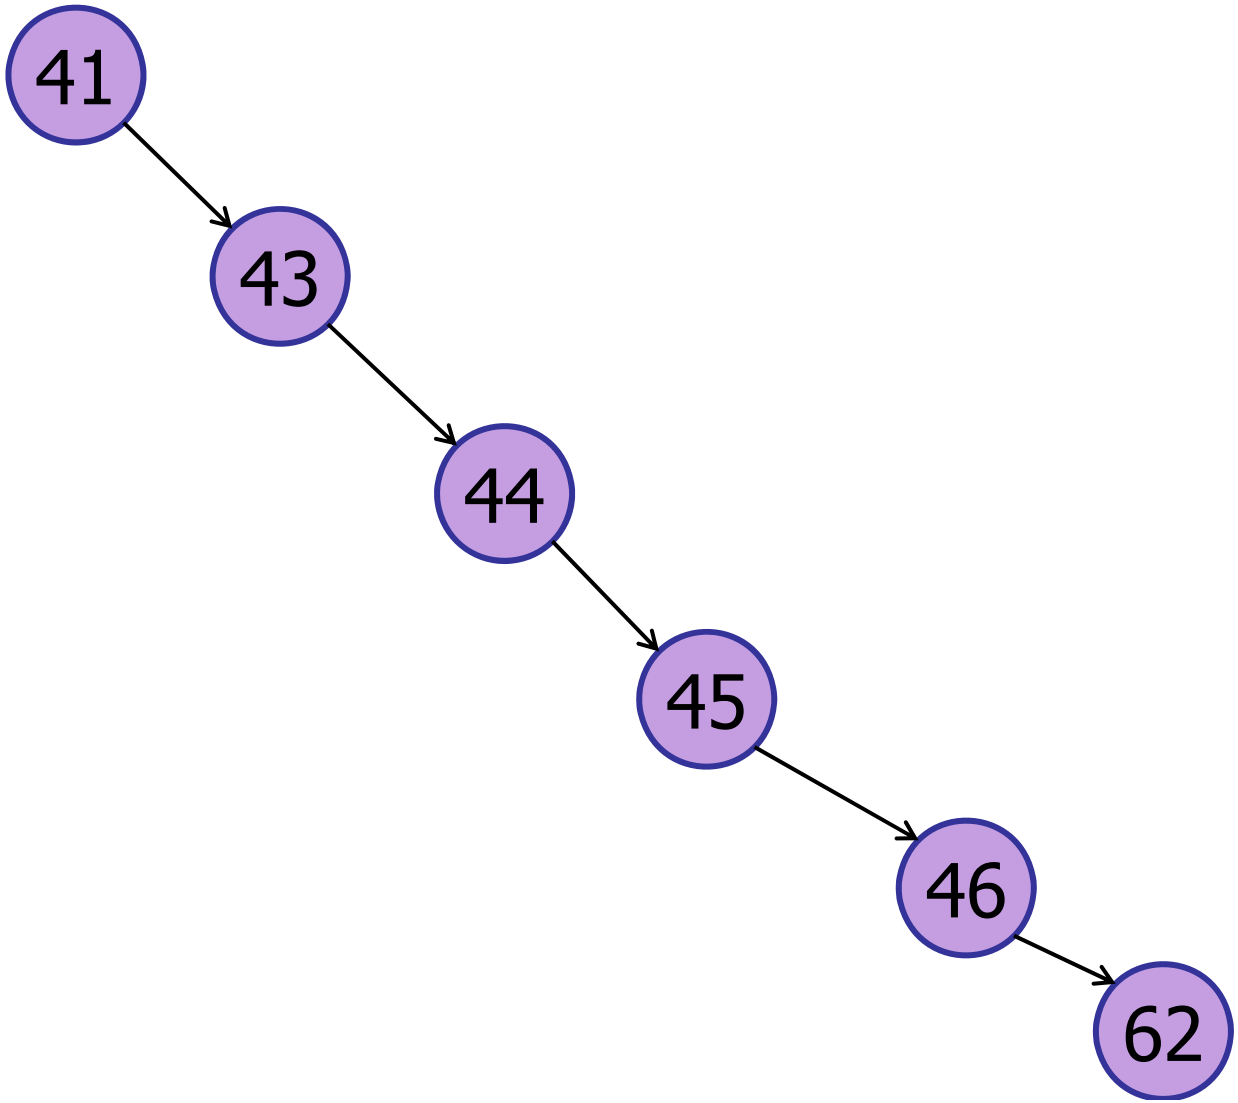
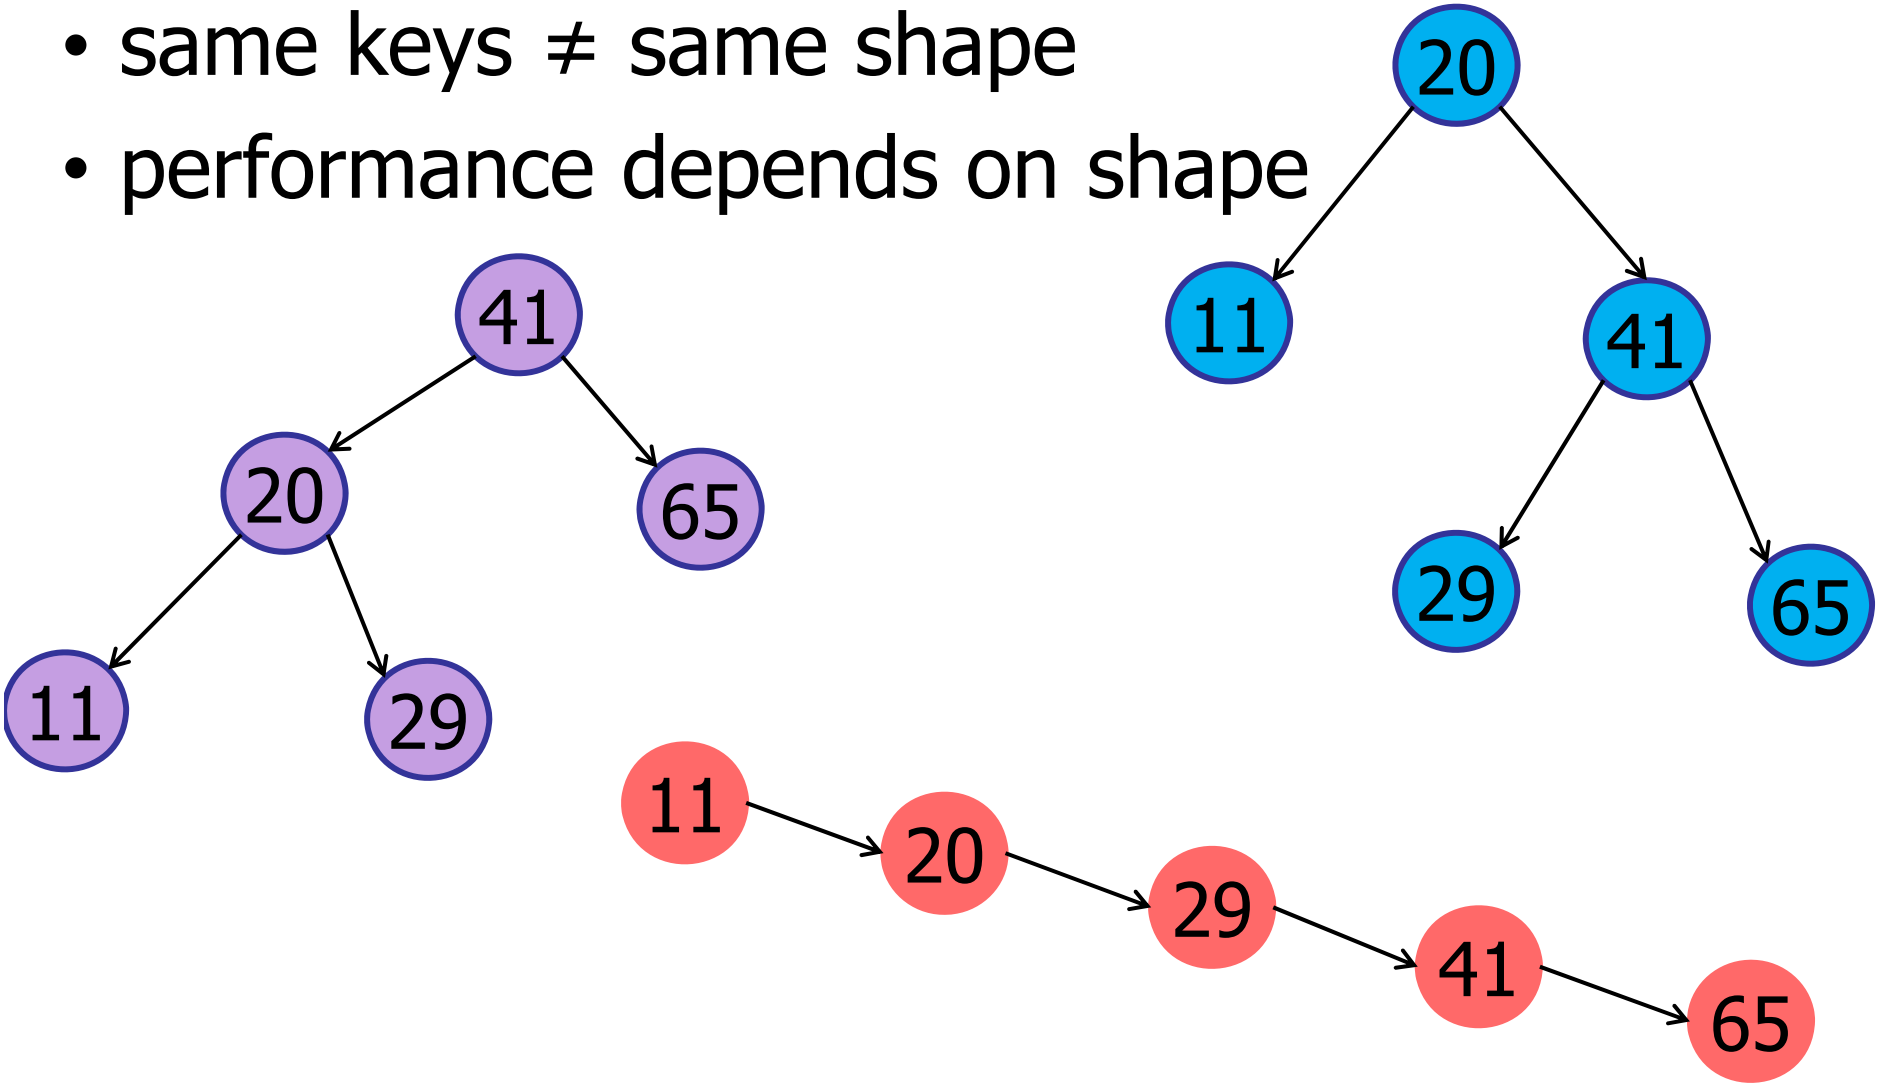
search(72) : O(height)



Tree Shape

Trees come in many shapes

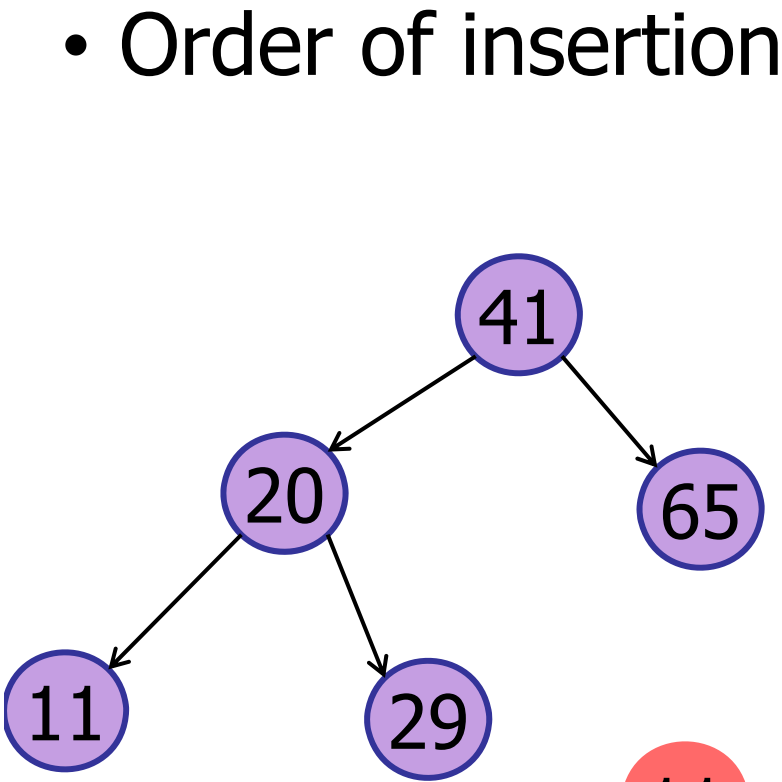
- same keys ≠ same shape
- performance depends on shape

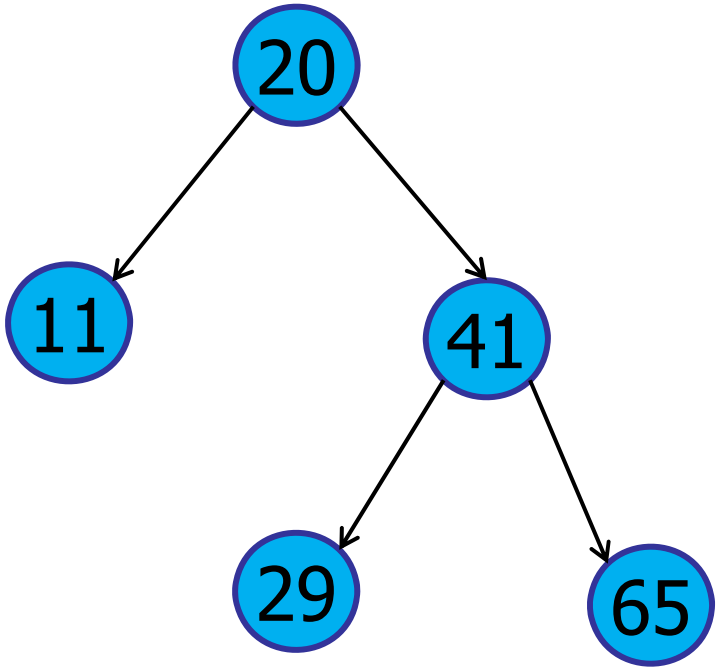


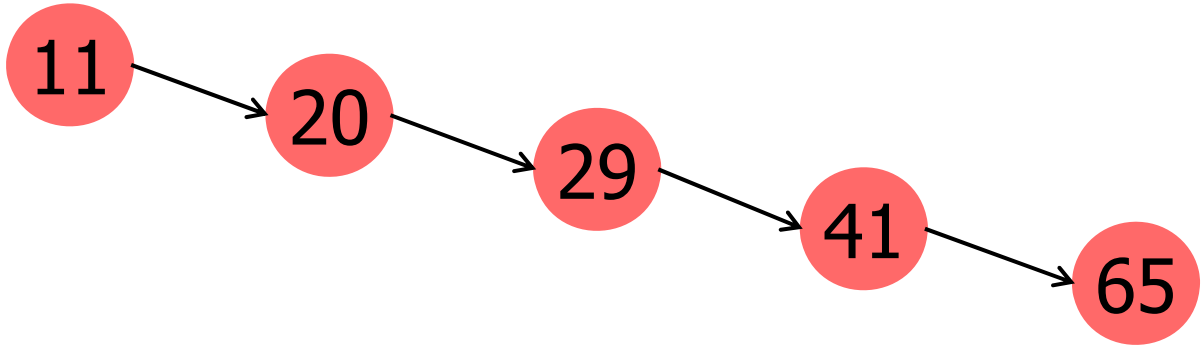
Tree Shape

What determines shape?

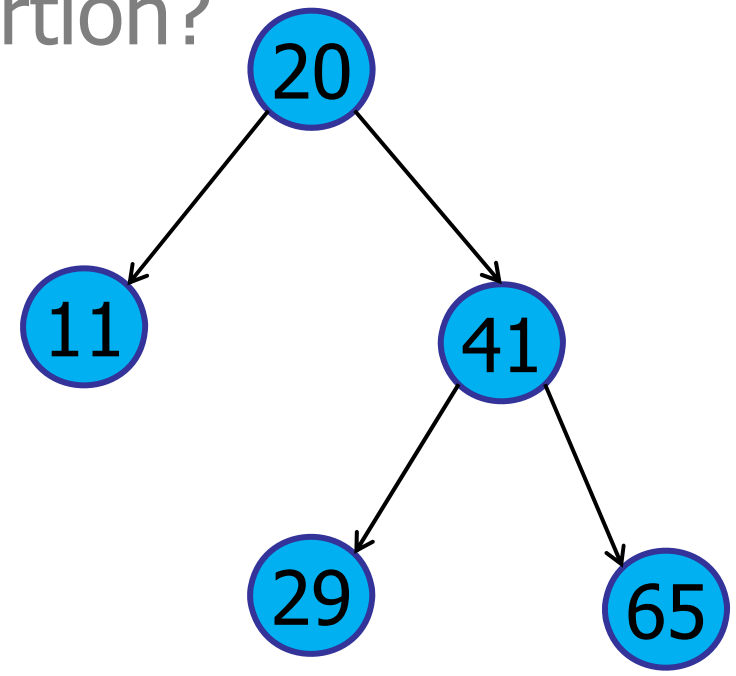
- Order of insertion





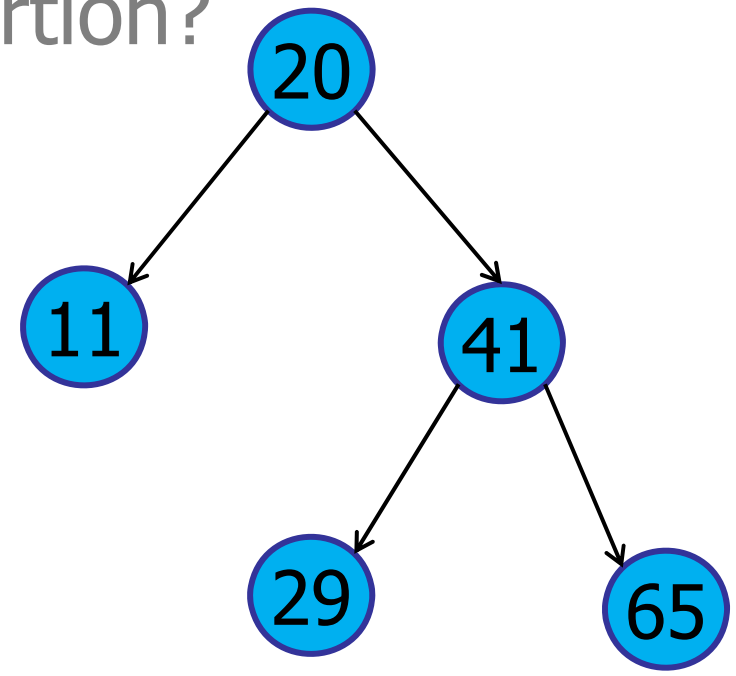


What was the order of insertion?



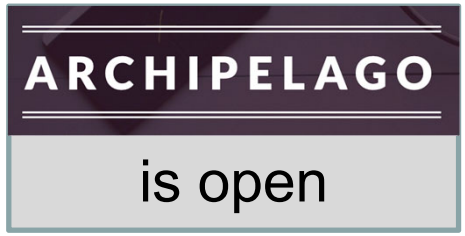
1. 11, 20, 29, 41, 65
2. 20, 11, 41, 29, 65
3. 11, 20, 41, 29, 65
4. 65, 41, 29, 20, 11
5. Impossible to tell.

What was the order of insertion?



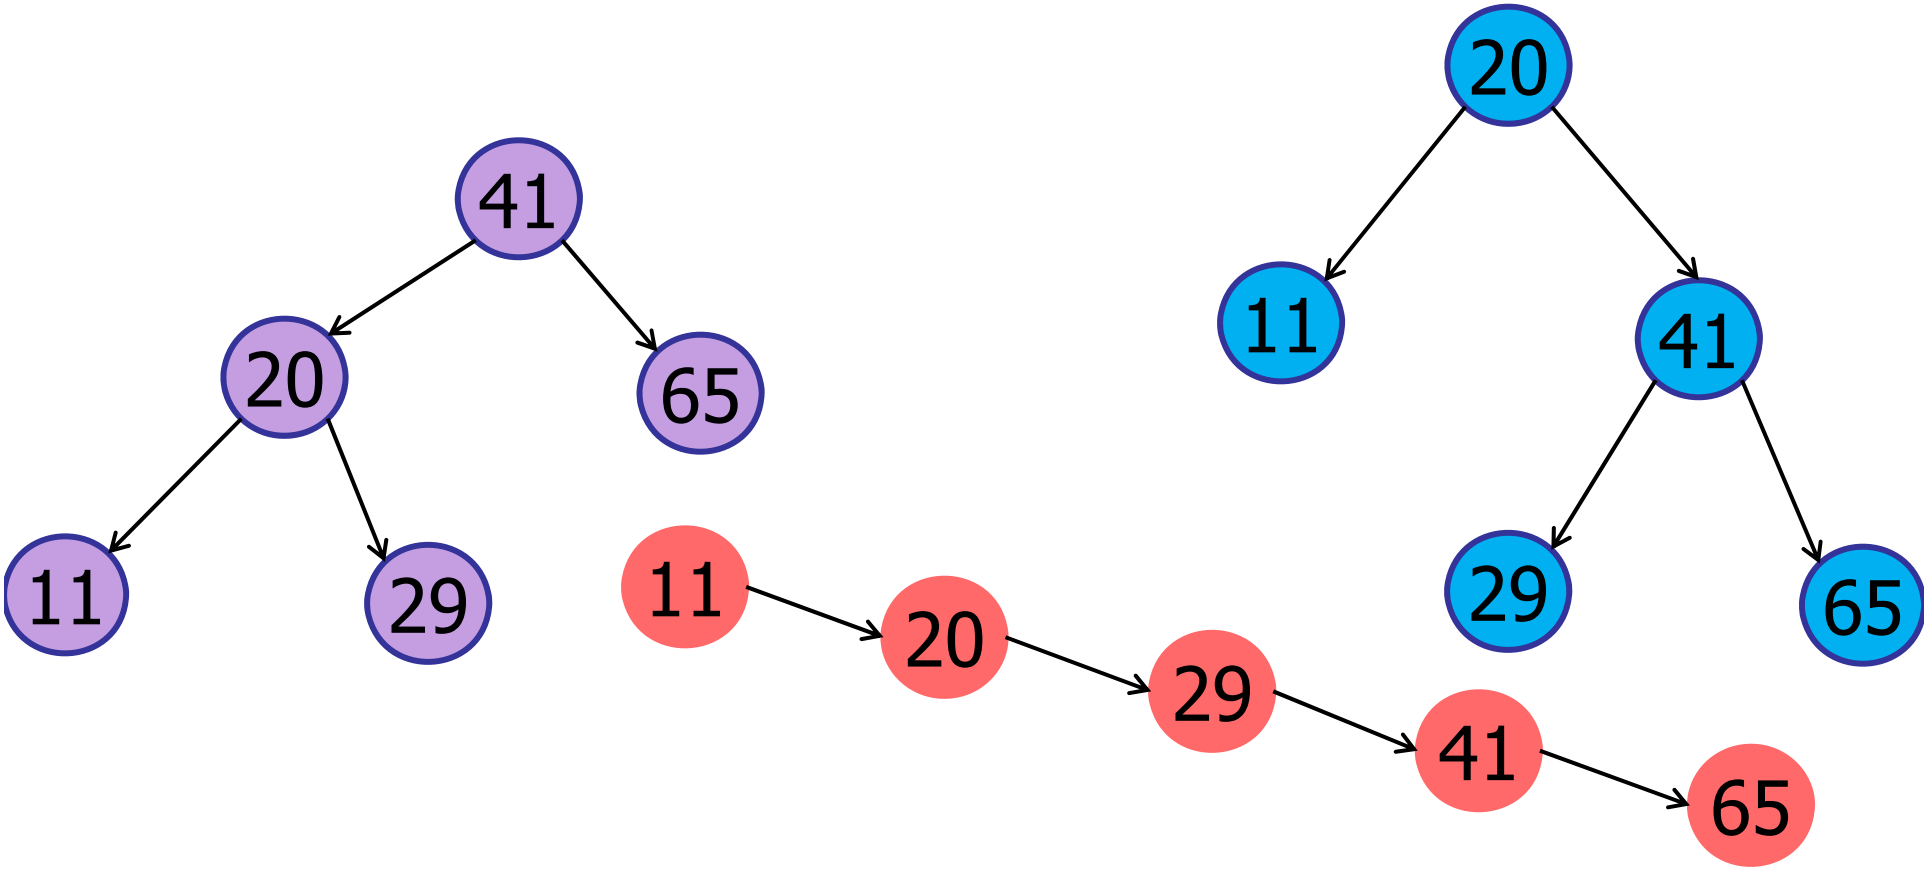
1. 11, 20, 29, 41, 65
2. ✓ 20, 11, 41, 29, 65
3. 11, 20, 41, 29, 65
4. 65, 41, 29, 20, 11
5. Impossible to tell.

Tree Shape



What determines shape?

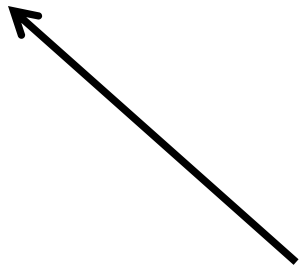
- Order of insertion
- Does each order yield a unique shape?



Tree Shape

What determines shape?

- Order of insertion
- Does each order yield a unique shape? NO
  - # ways to order insertions: n!
  - # shapes of a binary tree? $\sim 4^n$



Catalan Numbers

Tree Shape

Catalan Numbers

C_n = # of trees with (n+1) nodes

C_n = # expressions with n pairs of matched parentheses

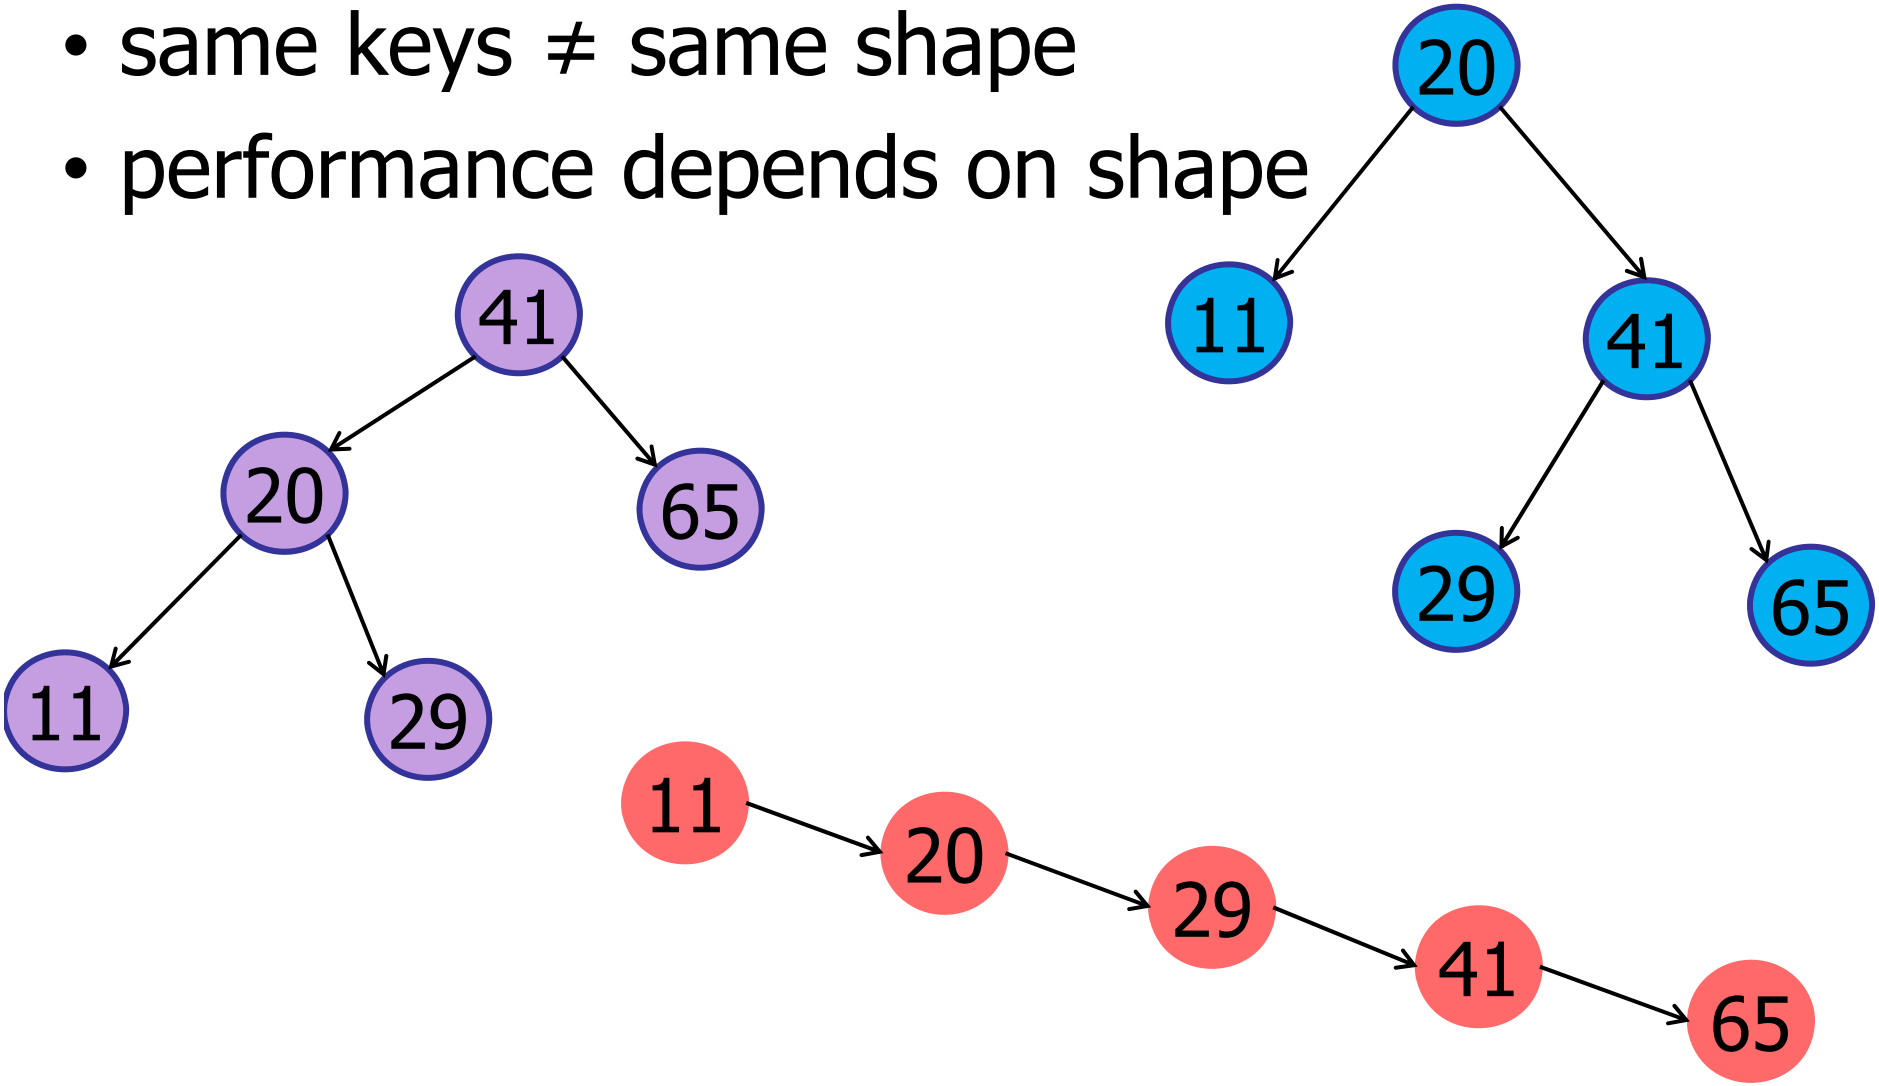
((())) ()(()) (()()) (())() ()()()

Puzzle: why are these the same?

Tree Shape

Trees come in many shapes

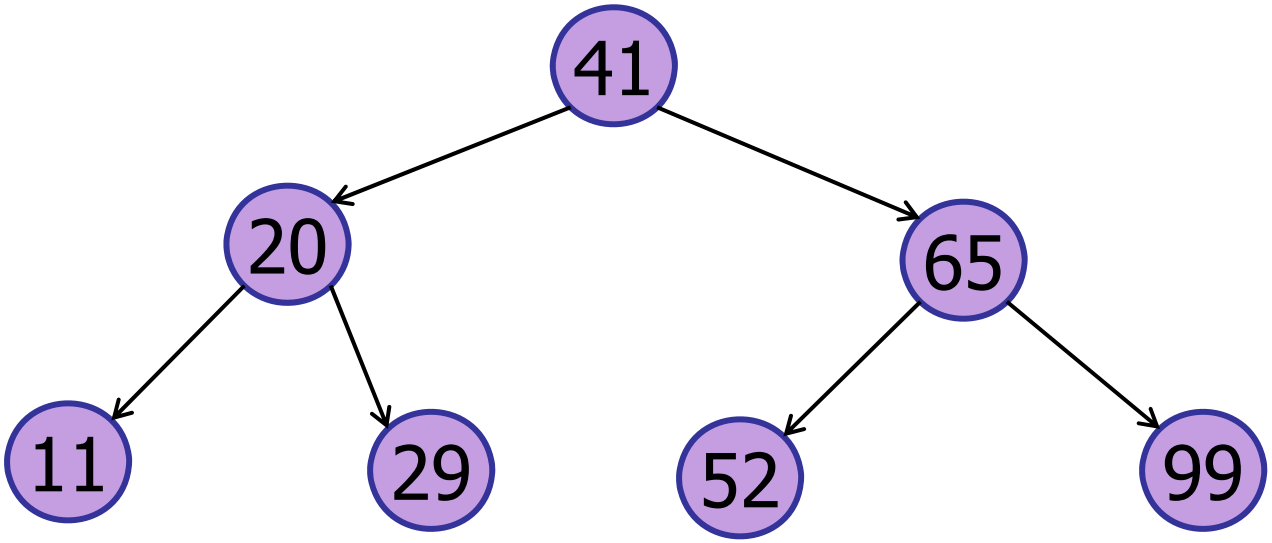
- same keys ≠ same shape
- performance depends on shape



Tree Shape

Trees come in many shapes

- same keys ≠ same shape
- performance depends on shape
- insert keys in a *random* order ⇒ balanced



Binary Search Trees

1. Terminology and Definitions

2. Basic operations:
   - height
   - searchMin, searchMax
   - search, insert

3. Traversals
   - in-order, pre-order, post-order

Tree Traversal

in-order-traversal(v)

```
public void in-order-traversal(){
        // Traverse left sub-tree
        if (leftTree != null)
                leftTree.in-order-traversal();

        visit(this);

        // Traverse right sub-tree
        if (rightTree != null)
                rightTree.in-order-traversal();
}
```

How long does an in-order-traversal take?

1. O(1)
2. O(log n)
3. O(n)
4. O(n log n)
5. $O(n^2)$
6. $O(2^n)$

How long does an in-order-traversal take?

1. O(1)
2. O(log n)
3. O(n)
4. O(n log n)
5. $O(n^2)$
6. $O(2^n)$

Note: searching for all the items is going to be slower!

Tree Traversal

in-order-traversal(v)

```
public void in-order-traversal(){
        // Traverse left sub-tree
        if (leftTree != null)
                leftTree.in-order-traversal();

        visit(this);

        // Traverse right sub-tree
        if (rightTree != null)
                rightTree.in-order-traversal();
}
```

Running time: O(n)

- visits each node at most once

Tree Traversals

Several varieties:

- pre-order
- in-order
- post-order
- level-order

Tree Traversals

Tree implements Iterable<Key>

- pre-order iterator
- in-order iterator
- post-order iterator
- level-order iterator

Tree Traversals

Tree implements Iterable<Key>

```
private class TreeIterator implements Iterator<Key>{

        BinaryTree currentNode;

        public boolean hasNext(){
                return (current != null);
        }

        public Key next(){
                // What goes here?
        }
}
```

Tree Traversals

Tree implements Iterable<Key>

- pre-order iterator
- in-order iterator
- post-order iterator
- level-order iterator

Tree Traversals

Tree implements Iterable<Key>

```
private class TreeIterator implements Iterator<Key>{

        BinaryTree currentNode;

        public boolean hasNext(){
                return (current != null);
        }

        public Key next(){
                // What goes here?
        }
}
```

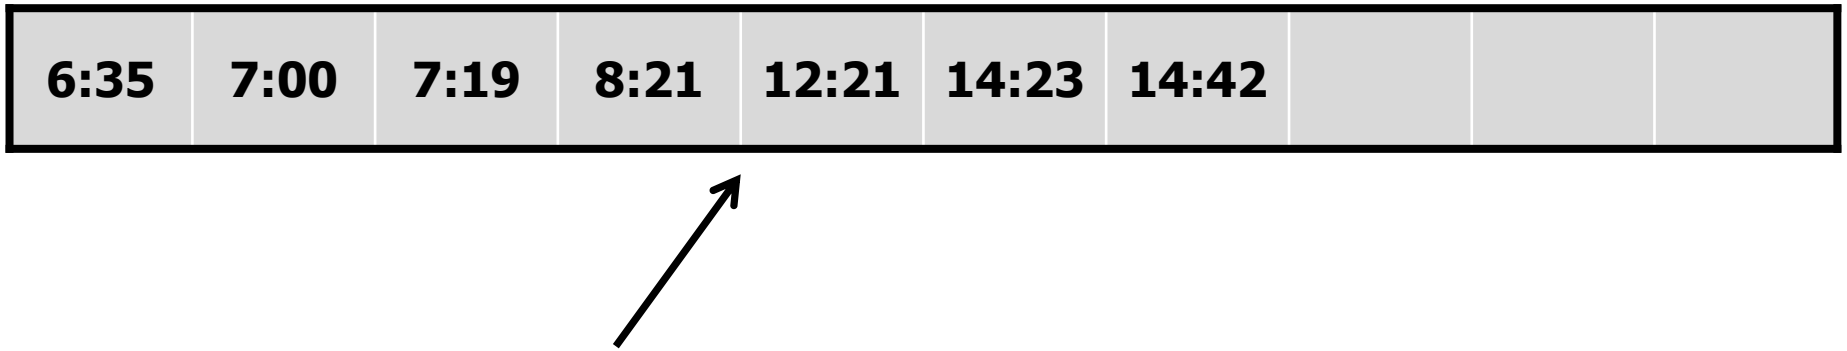
Airport Scheduling

Dictionary

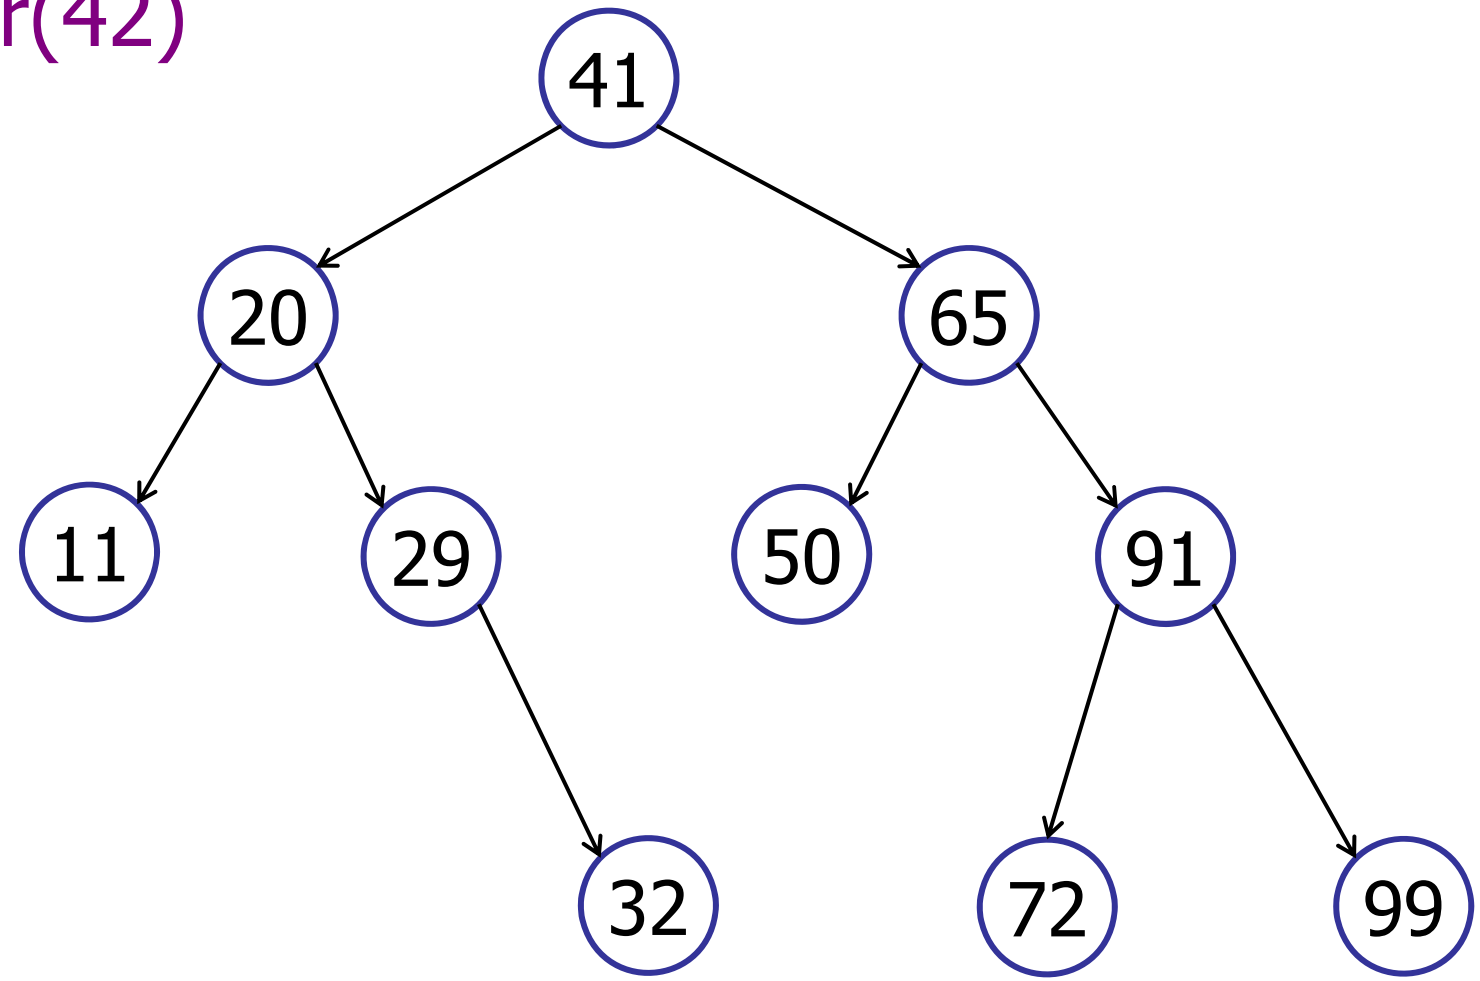


- successor(8:24) = 12:21

How do we implement this?

Successor: Key not in the Tree

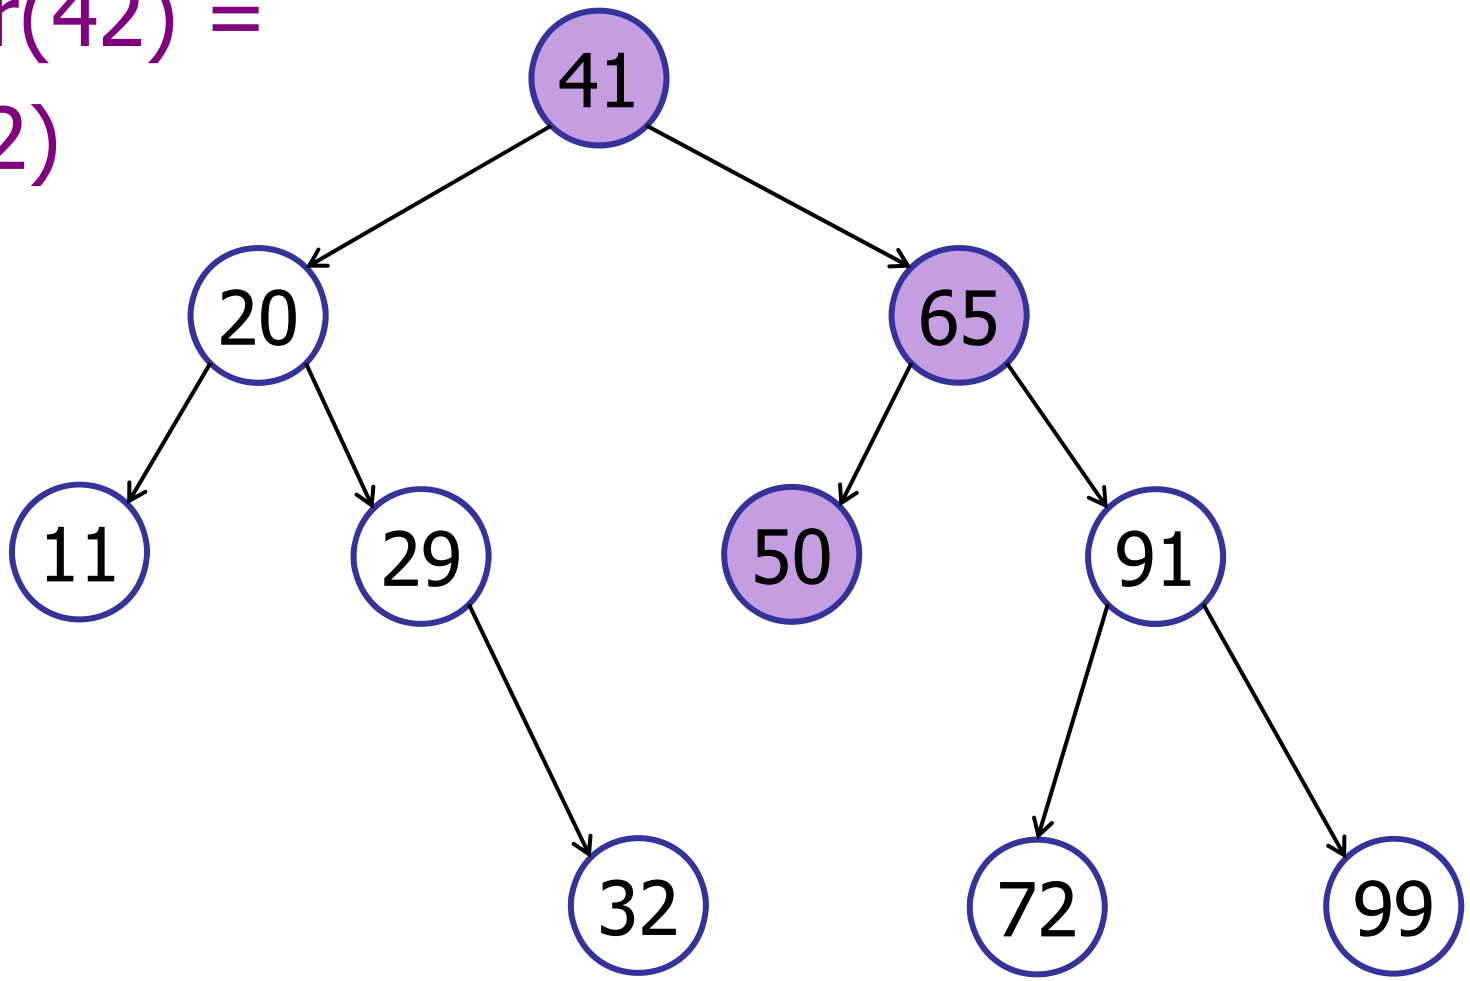
successor(42)



Key 42 is not in the tree

Successor: Key not in the Tree

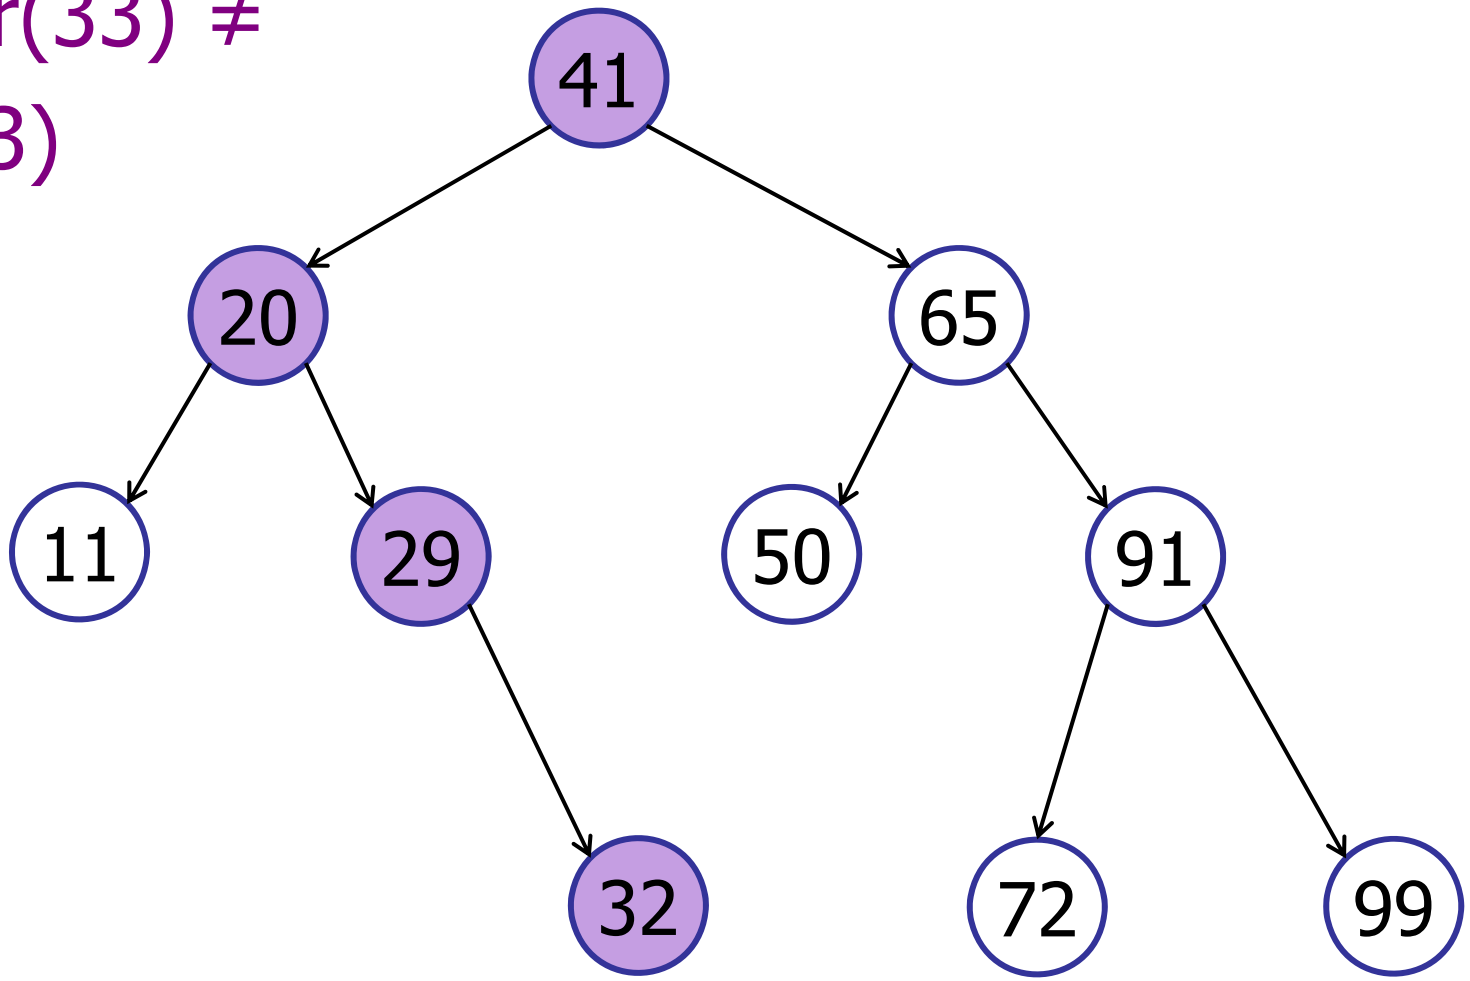
successor(42) =
search(42)



Key 42 is not in the tree

Successor: Key not in the Tree

successor(33) ≠
search(33)

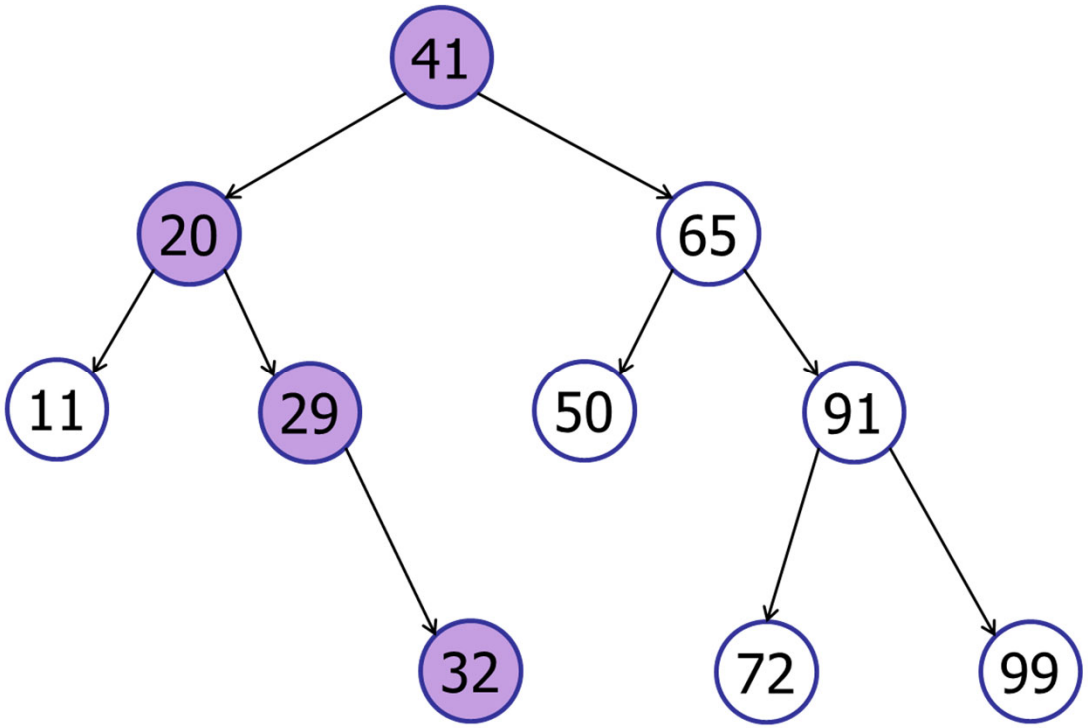


Key 33 is not in the tree

Successor: Key not in the Tree

If you search for a key not in the tree:

➔ either find predecessor
or successor.



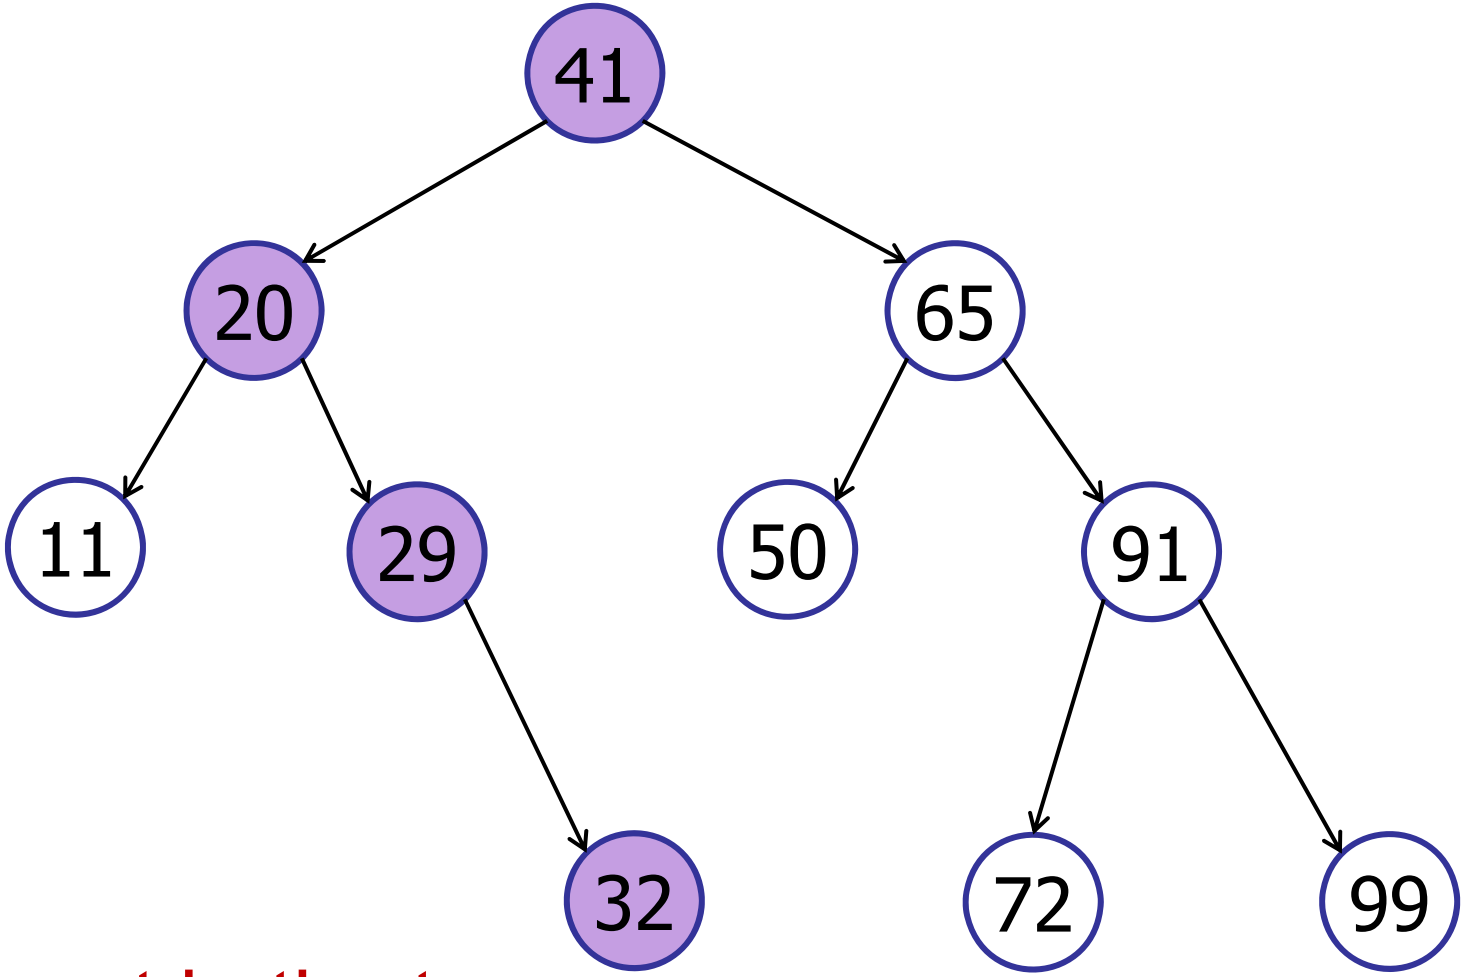
Successor Queries

Basic strategy: successor(key)

1. Search for key in the tree.
2. If (result > key), then return result.
3. If (result <= key), then search for successor of result.

Successor: Key not in the Tree

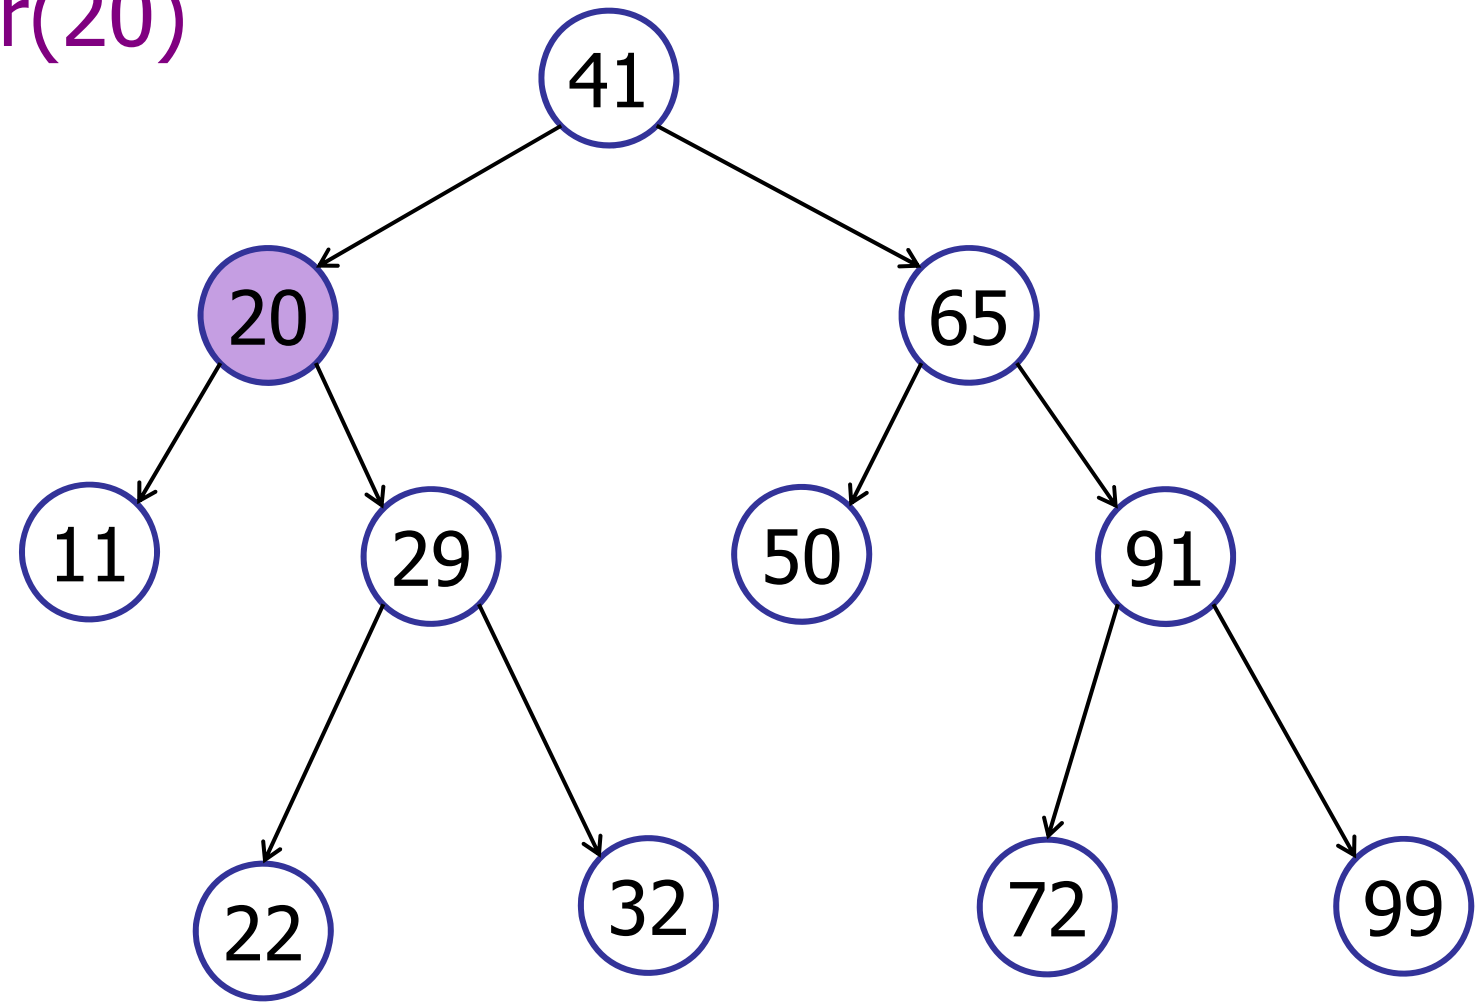
successor(33) = successor(32)



Key 33 is not in the tree

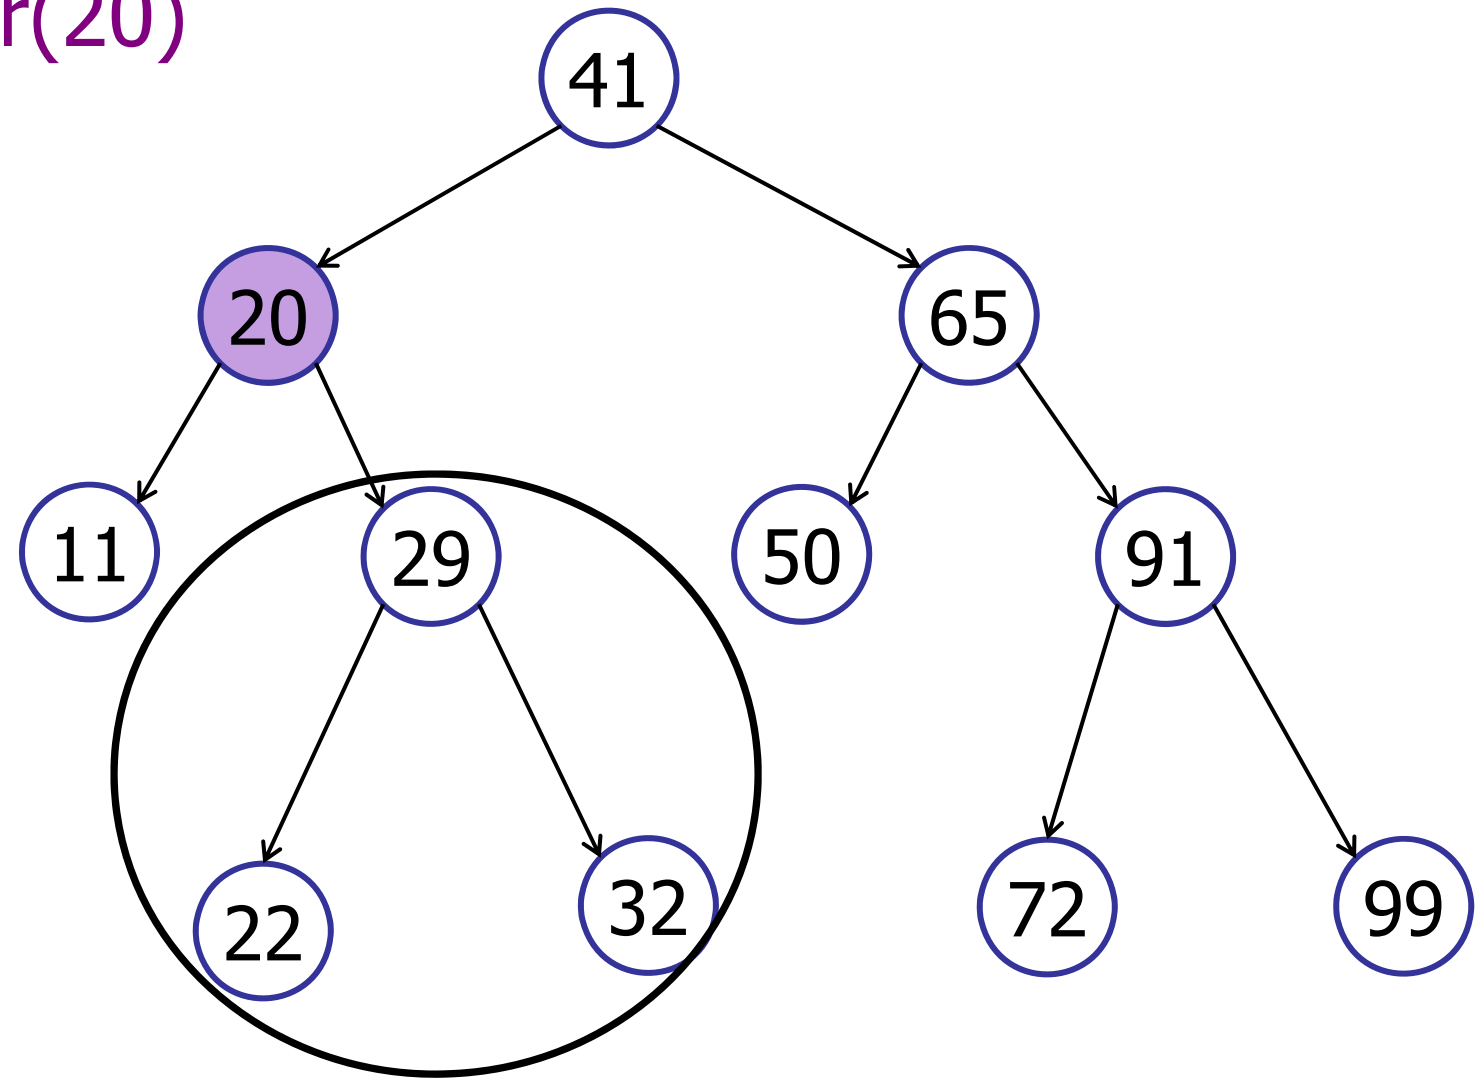
Successor: Key in the Tree

successor(20)



Successor Queries

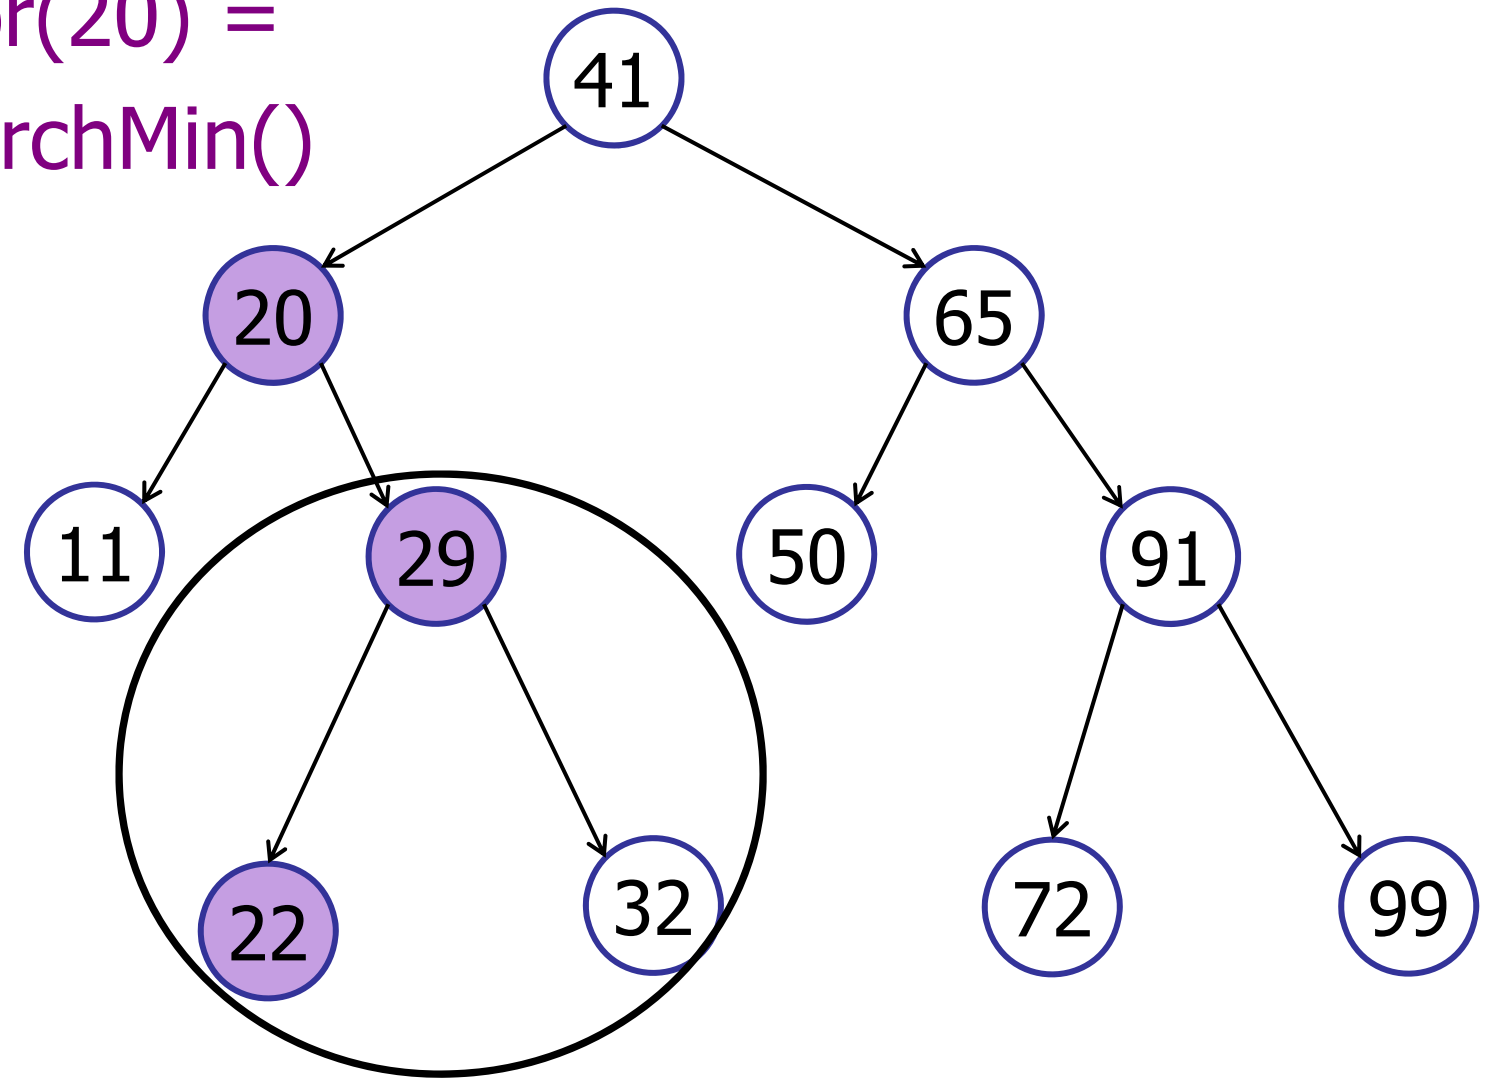
successor(20)



Case 1: node has a right child.

Successor Queries

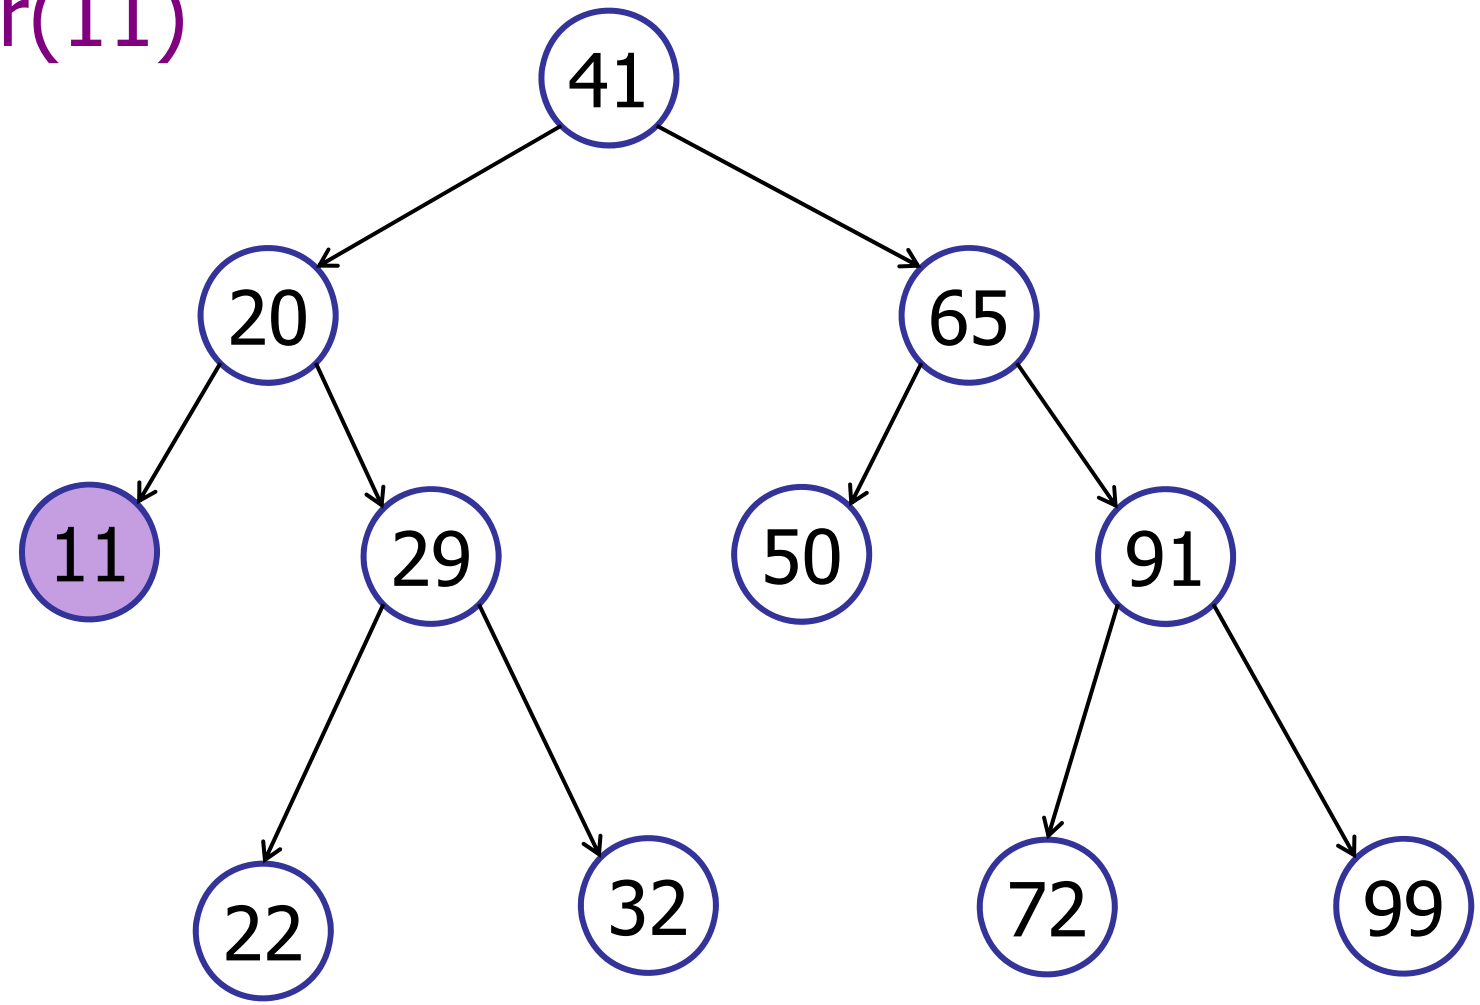
successor(20) =
right.searchMin()



Case 1: node has a right child.

Successor Queries

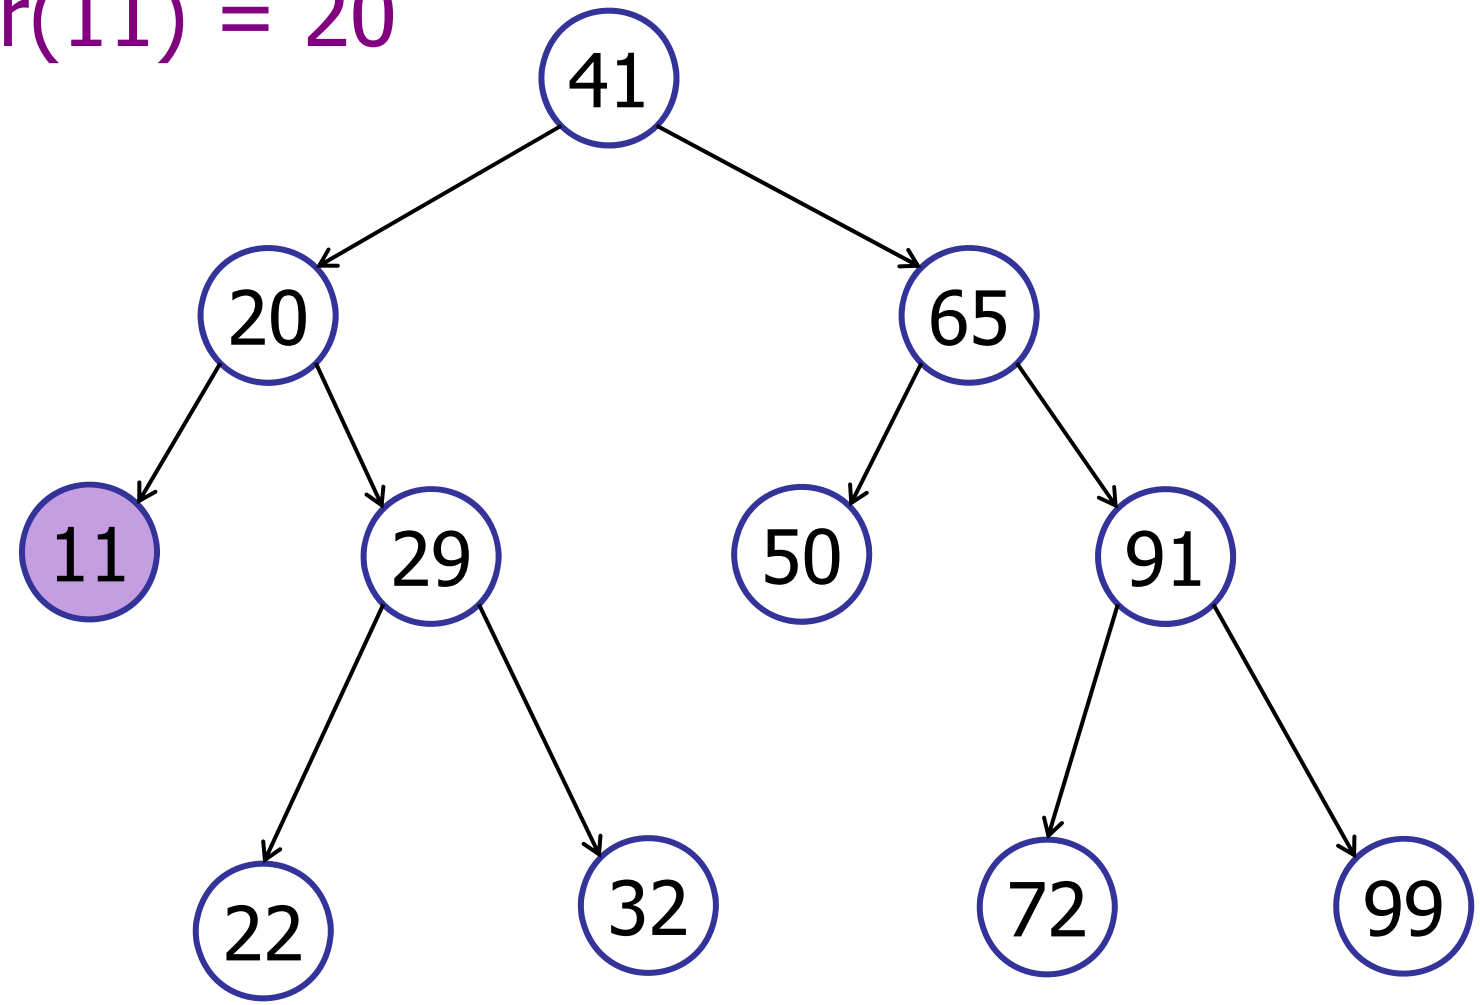
successor(11)



Case 2: node has no right child.

Successor Queries

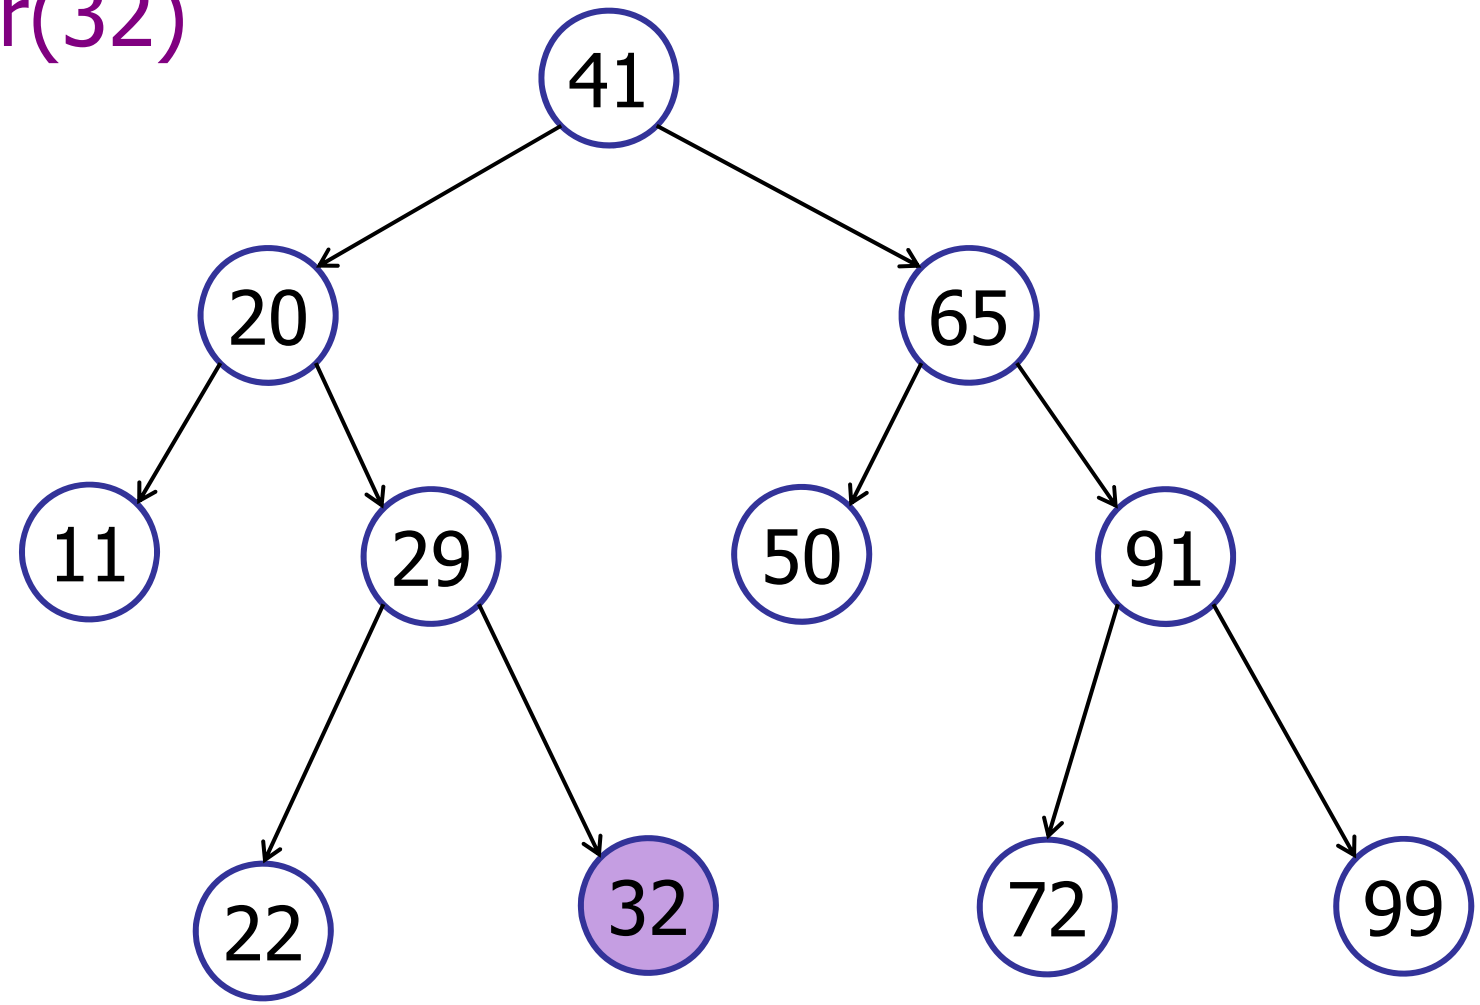
successor(11) = 20



Case 2: node has no right child.

Successor Queries

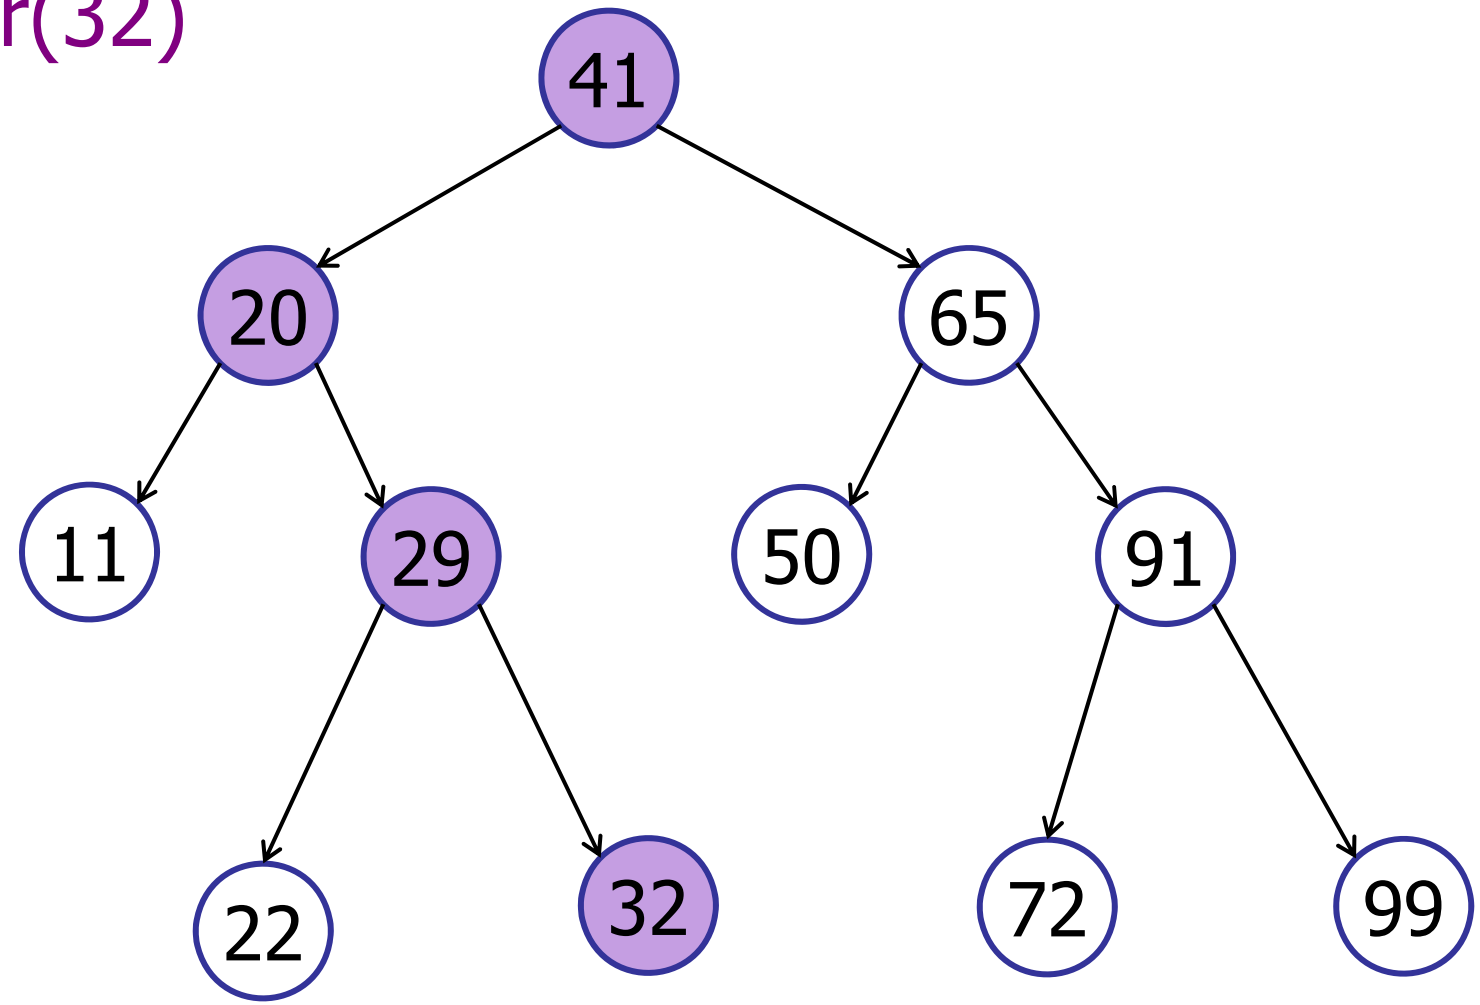
successor(32)



Case 2: node has no right child.

Successor Queries

successor(32)



Case 2: node has no right child.

Successor Queries

Find the next TreeNode:

```
public TreeNode successor(){
        if (rightTree != null)
                return rightTree.searchMin();

        TreeNode parent = parentTree;
        TreeNode child = this;
        while ((parent != null) && (child == parent.rightTree))
                child = parent;
                parent = child.parentTree;
        }
        return parent;
}
```

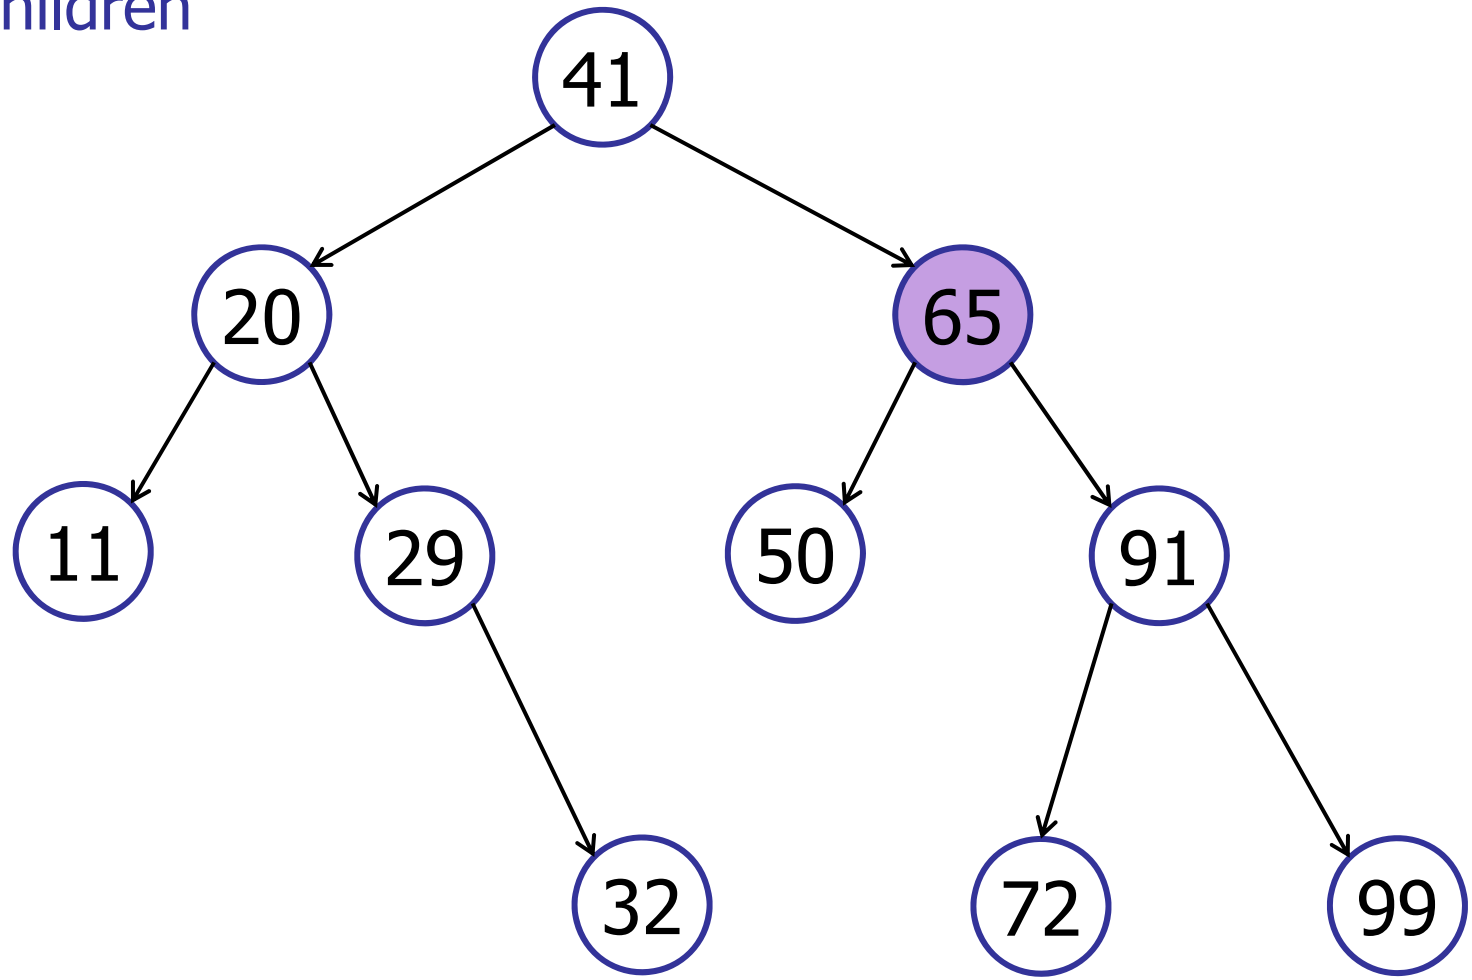
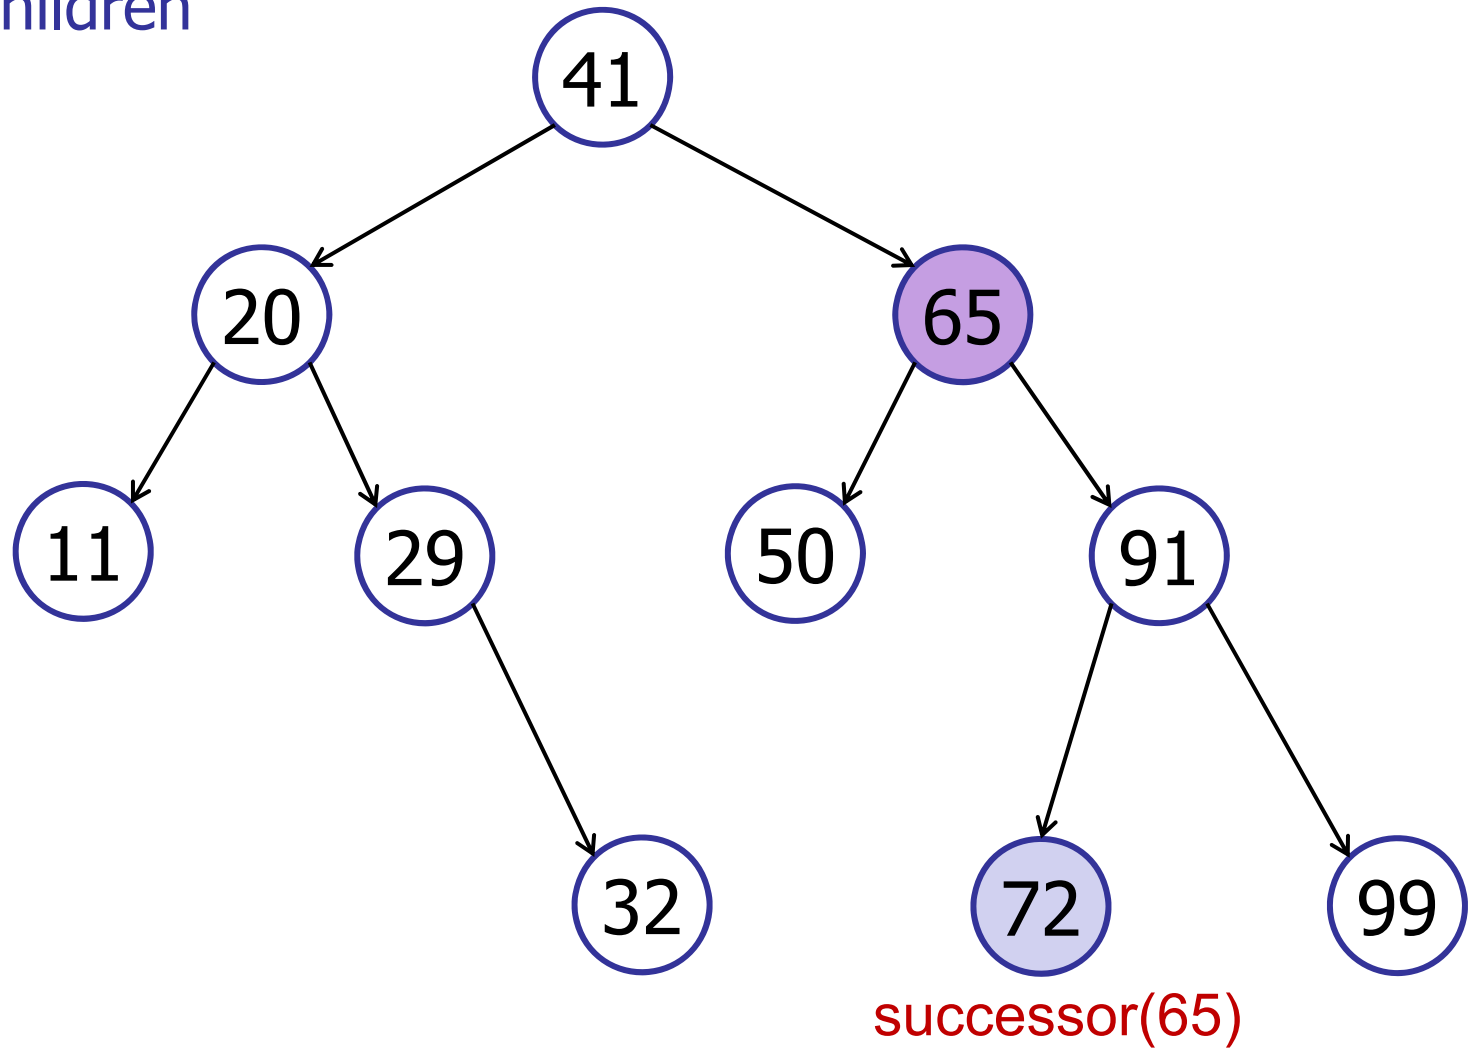
Case 3: 2 children



Binary Search Tree

delete(65)

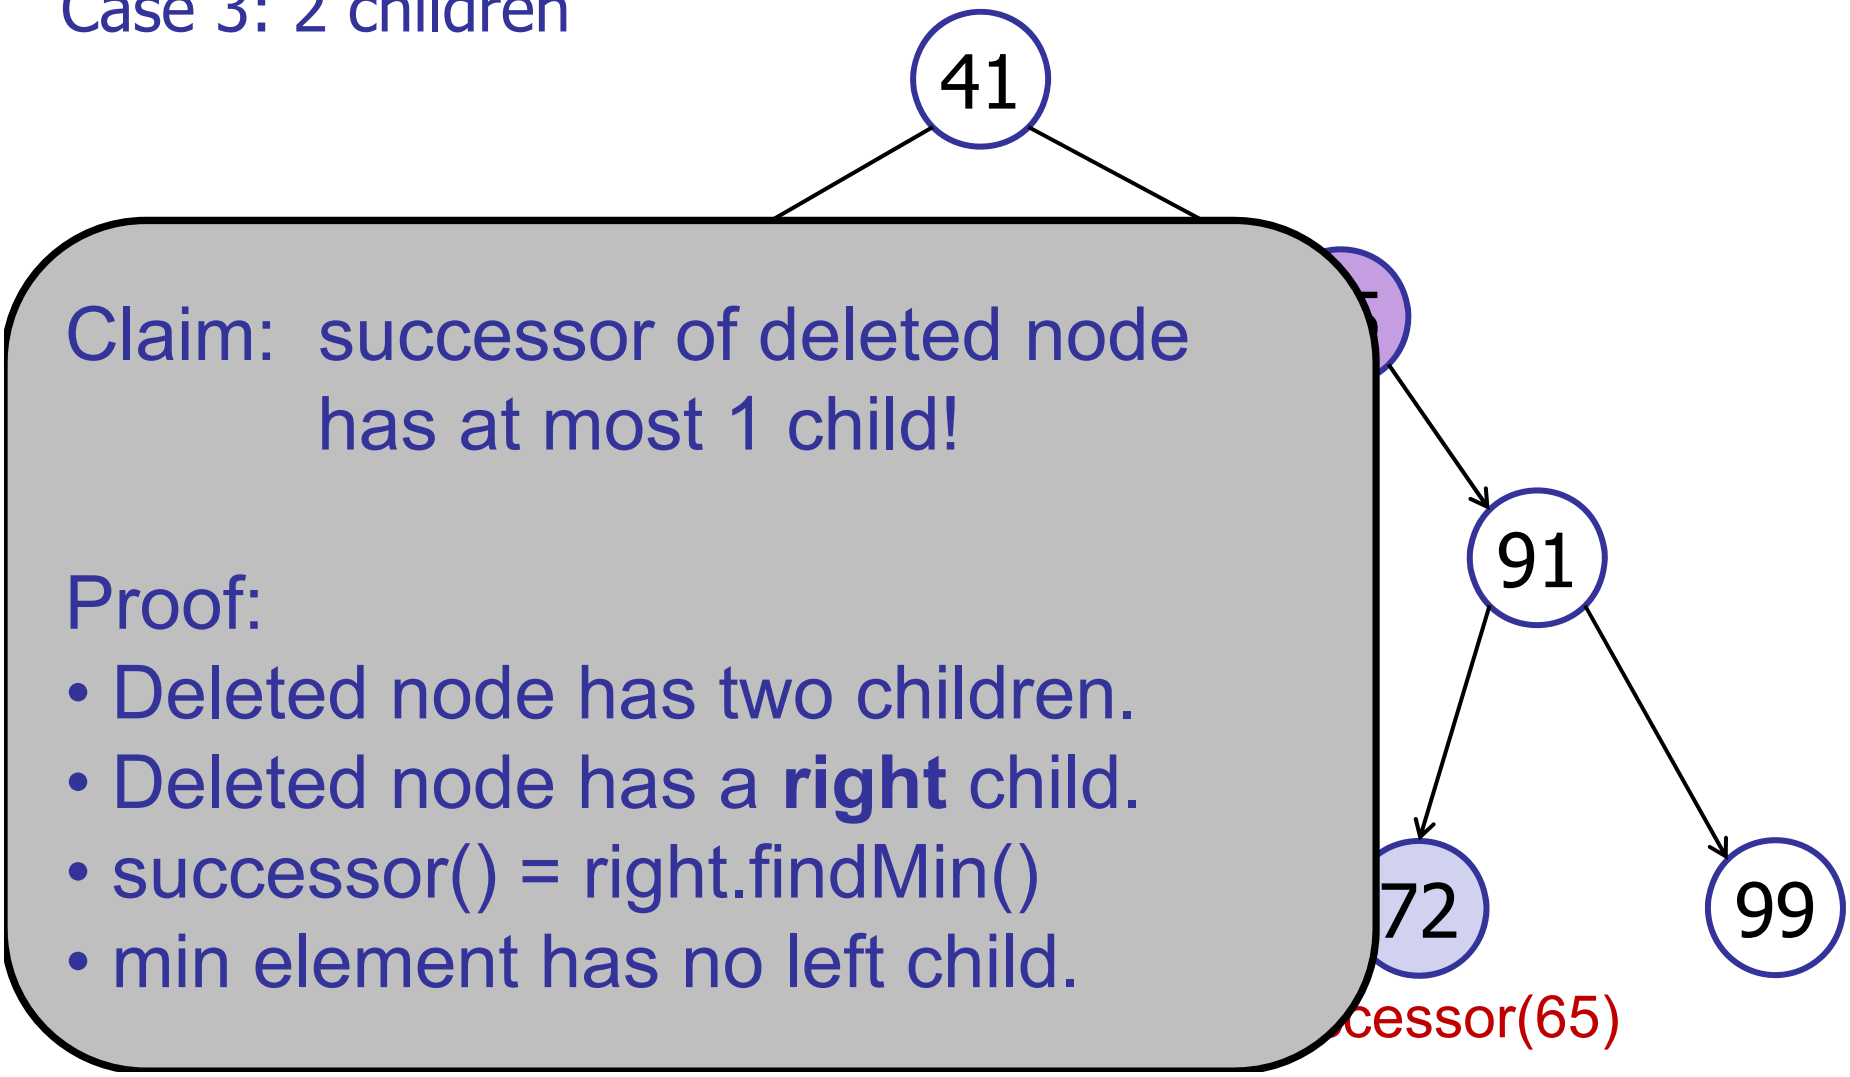
Case 3: 2 children



Binary Search Tree

delete(65)

Case 3: 2 children



Claim: successor of deleted node has at most 1 child!

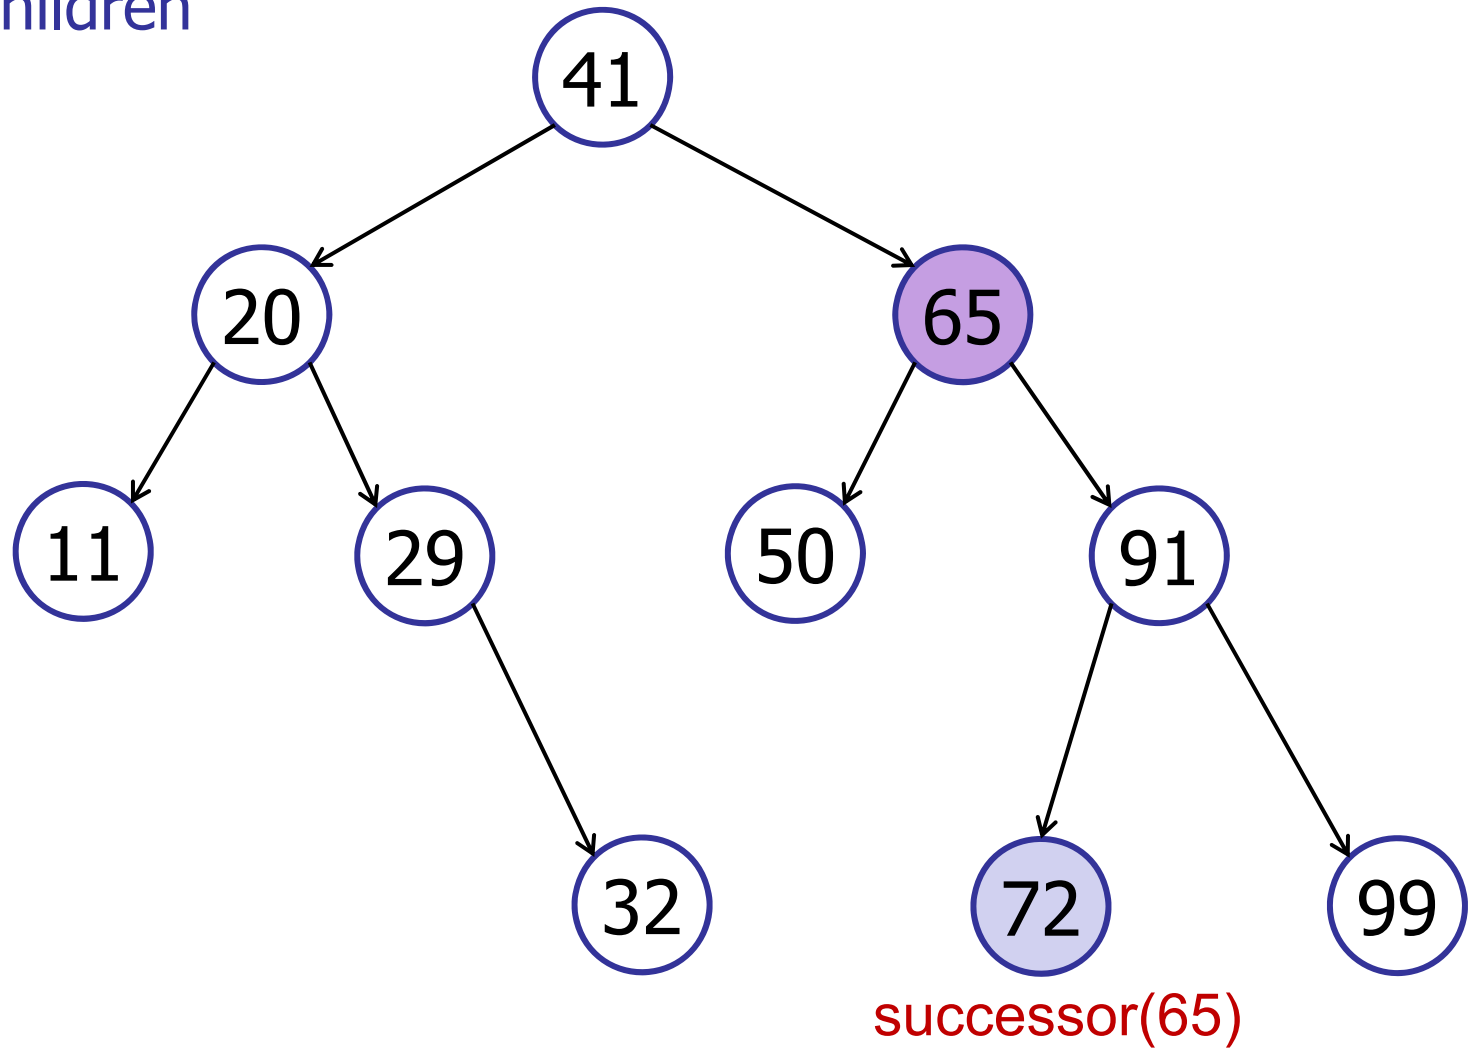
Proof:

- Deleted node has two children.
- Deleted node has a **right** child.
- successor() = right.findMin()
- min element has no left child.

Binary Search Tree

delete(65)

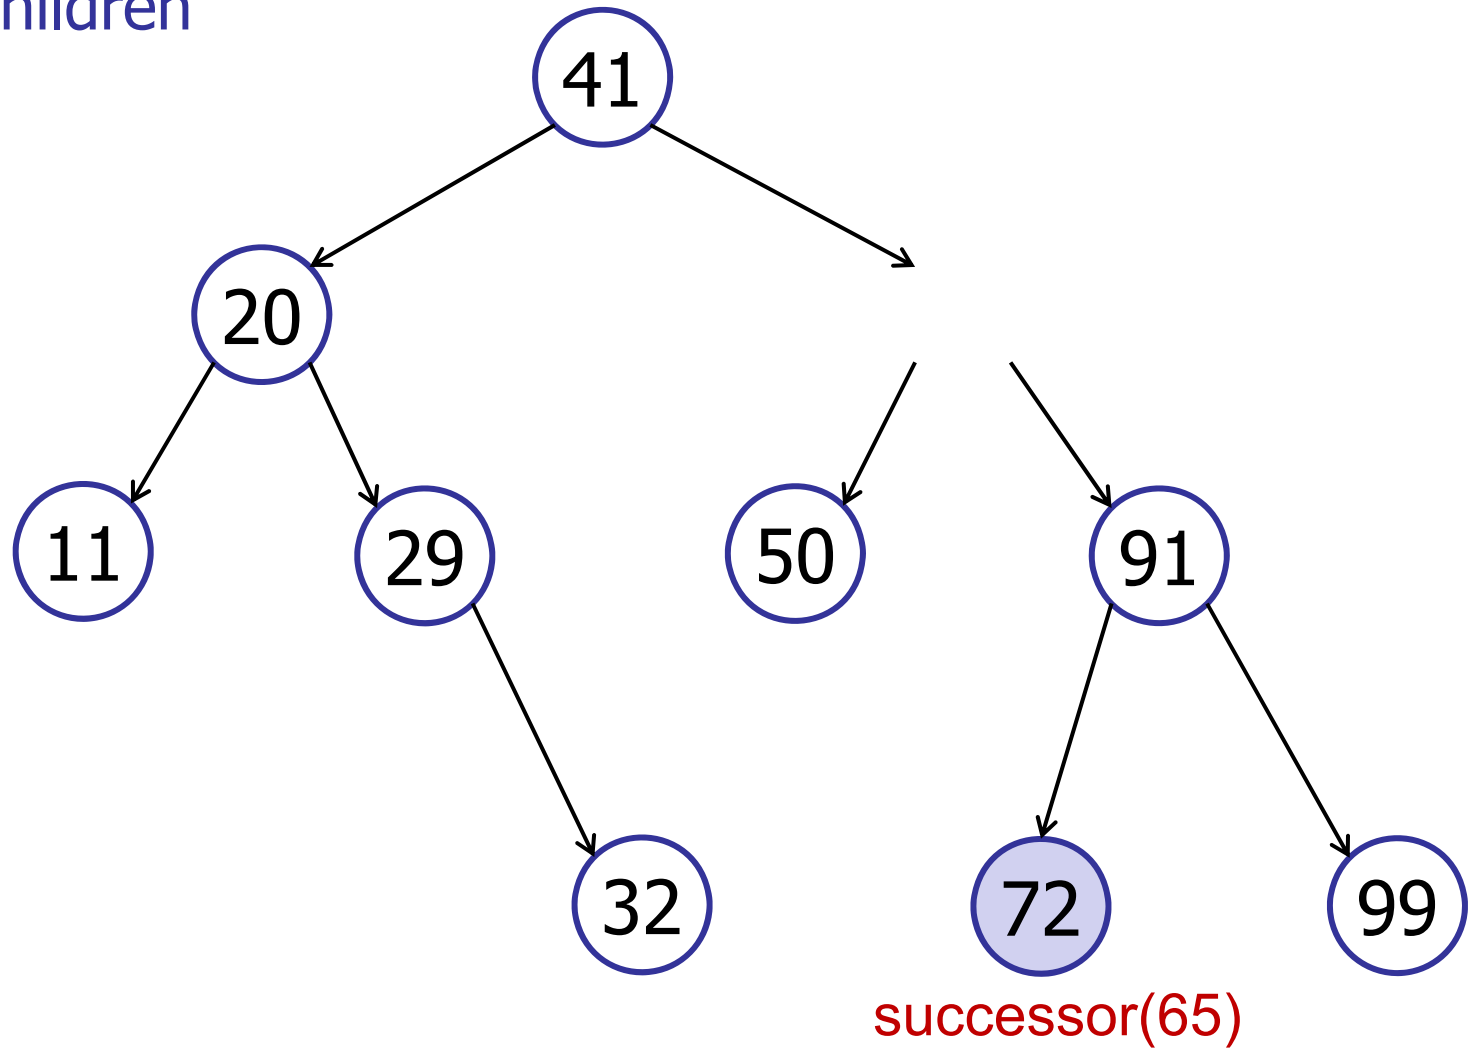
Case 3: 2 children



Binary Search Tree

delete(65)

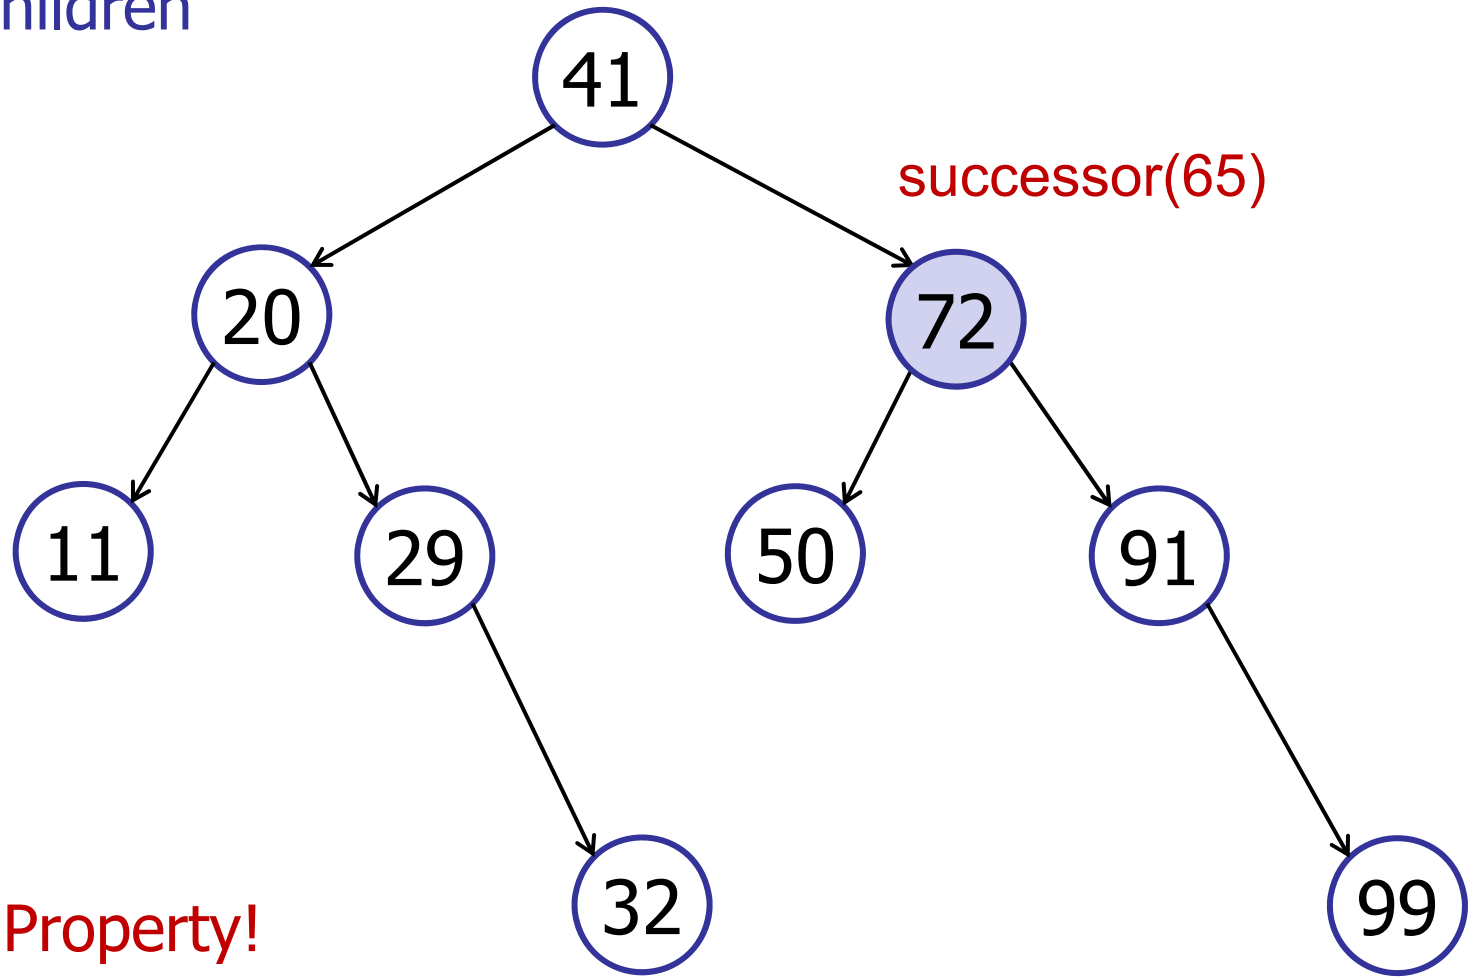
Case 3: 2 children



Binary Search Tree

delete(65)

Case 3: 2 children



Check BST Property!

Binary Search Tree

delete(v) Running time: O(height)

Three cases:

1. No children:
   - remove v
2. 1 child:
   - remove v
   - connect child(v) to parent(v)
3. 2 children
   - x = successor(v)
   - delete(x)
   - remove v
   - connect x to left(v), right(v), parent(v)

Binary Search Tree

Modifying Operations

- insert: O(h)
- delete: O(h)

Query Operations:

- search: O(h)
- predecessor, successor: O(h)
- findMax, findMin: O(h)
- in-order-traversal: O(n)
